| | |
|--|-----------|
| APPLICABILITY TABLE | 2 |
| CONTENTS | 3 |
| 1. INTRODUCTION | 20 |
| 1.1. Scope | 20 |
| 1.2. Audience | 20 |
| 1.3. Contact Information, Support | 20 |
| 1.4. Symbol Convention | 21 |
| 2. COMMANDS | 23 |
| 2.1. Definitions | 23 |
| 2.2. AT Command Syntax | 24 |
| 2.2.1. String Type Parameters | 25 |
| 2.2.2. Command Lines | 25 |
| 2.2.2.1. ME Error Result Code - +CME ERROR: <err> | 26 |
| 2.2.2.2. Message Service Failure Result Code - +CMS ERROR: <err> | 34 |
| 2.2.2.3. Carriage Returns, Line Feeds and Log | 36 |
| 2.2.3. Information Responses and Result Codes | 36 |
| 2.2.4. Command Response Time-Out | 37 |
| 2.2.5. Command Issuing Timing | 38 |
| 2.3. Storage | 38 |
| 2.3.1. Factory Profile and User Profiles | 38 |
| 2.4. AT Command Short Overview Table | 40 |
| 3. AT COMMANDS REFERENCES | 41 |
| 3.1. Call & DTMF | 41 |
| 3.1.1. AT+CHUP - Hang Up Call | 41 |
| 3.1.2. AT#ECAM - Extended Call Monitoring | 42 |
| 3.1.3. AT+VTS - DTMF Tones Transmission | 45 |
| 3.1.4. AT+VTD - Tone Duration | 47 |
| 3.2. General Control and Config | 49 |
| 3.2.1. Command Line Prefixes | 49 |
| 3.2.1.1. AT - Starting a Command Line | 49 |

| | | |
|-----------|---|----|
| 3.2.1.2. | A/ - Last Command Automatic Repetition | 50 |
| 3.2.1.3. | AT#/ - Repeat Last Command | 51 |
| 3.2.2. | Generic Modem Control | 52 |
| 3.2.2.1. | AT#SELINT - Select Interface Style | 52 |
| 3.2.2.2. | AT&F - Set to Factory-Defined Configuration | 53 |
| 3.2.2.3. | ATZ - Soft Reset | 54 |
| 3.2.2.4. | AT&Y - Default Reset Basic Profile Designation | 55 |
| 3.2.2.5. | AT&P - Default Reset Full Profile Designation | 56 |
| 3.2.2.6. | AT&W - Store Current Configuration | 57 |
| 3.2.2.7. | AT&N - Display Internal Phonebook Stored Numbers | 58 |
| 3.2.2.8. | AT#Z - Extended Reset | 59 |
| 3.2.2.9. | AT&V - Display some Configuration and Profile | 60 |
| 3.2.2.10. | AT+GCI - Country of Installation | 62 |
| 3.2.2.11. | AT+GCAP - Capabilities List | 63 |
| 3.2.2.12. | AT+GMI - Manufacturer Identification | 64 |
| 3.2.2.13. | AT+GMM - Model Identification | 65 |
| 3.2.2.14. | AT+GMR - Revision Identification | 66 |
| 3.2.2.15. | AT+GSN - Serial Number | 67 |
| 3.2.2.16. | AT+CGMI - Request Manufacturer Identification | 68 |
| 3.2.2.17. | AT+CGMM - Request Model Identification | 69 |
| 3.2.2.18. | AT+CGMR - Request Revision Identification | 70 |
| 3.2.2.19. | AT+CGSN - Request Product Serial Number Identification | 71 |
| 3.2.2.20. | AT#CGMI - Request Manufacturer Identification | 72 |
| 3.2.2.21. | AT#CGMR - Request Revision Identification | 73 |
| 3.2.2.22. | AT#CGSN - Product Serial Number Identification | 74 |
| 3.2.2.23. | AT#CGMF - Request Product Code | 75 |
| 3.2.2.24. | AT#SWPKGV - Request Software Package Version | 76 |
| 3.2.2.25. | AT+CPAS - Phone Activity Status | 78 |
| 3.2.2.26. | AT+CFUN - Set Phone Functionality | 80 |
| 3.2.2.27. | AT+CMER - Mobile Equipment Event Reporting | 83 |
| 3.2.2.28. | AT+CSVM - Set Voice Mail Number | 86 |
| 3.2.2.29. | AT#MBN - Mailbox Numbers | 88 |

| | | |
|-----------|---|-----|
| 3.2.2.30. | AT#MWI - Message Waiting Indication | 90 |
| 3.2.2.31. | AT+CLAC - Available AT Commands | 93 |
| 3.2.2.32. | AT#LANG - Select Language | 94 |
| 3.2.2.33. | AT+CMEE - Report Mobile Equipment Error | 95 |
| 3.2.2.34. | AT#CEER - Extended Numeric Error Report | 97 |
| 3.2.2.35. | AT#PSMRI - Power Saving Mode Ring Indicator | 100 |
| 3.2.2.36. | AT+CSCS - Select TE Character Set | 102 |
| 3.2.2.37. | AT+CMUX - Multiplexing Mode | 104 |
| 3.2.2.38. | AT#USBCFG - USB Configuration | 107 |
| 3.2.2.39. | AT#PORTCFG - Connect Physical Ports to Service Access Points..... | 109 |
| 3.2.2.40. | AT#ATDELAY - AT Command Delay | 112 |
| 3.2.2.41. | AT&Z - Store Telephone Number in the Internal Phonebook | 113 |
| 3.2.2.42. | AT&V2 - Display Last Connection Statistics | 114 |
| 3.2.2.43. | AT+IMEISV - Request IMEI and Software Version | 115 |
| 3.2.2.44. | AT#CGMM - Request Model Identification | 117 |
| 3.2.2.45. | AT&V0 - Display Current Configuration and Profile | 118 |
| 3.2.2.46. | AT#FWSWITCH - Set Active Firmware Image | 119 |
| 3.2.2.47. | AT#IMSPDPSET - IMS PDP APN Number Set | 122 |
| 3.2.2.48. | AT#TXCAL4G - Change Max TX Power Level for a Supported Band | 124 |
| 3.2.2.49. | AT#TID - Request Telit ID | 126 |
| 3.2.3. | S Parameters | 127 |
| 3.2.3.1. | ATS0 - Number of Rings to Auto Answer | 127 |
| 3.2.3.2. | ATS1 - Ring Counter | 129 |
| 3.2.3.3. | ATS2 - Escape Character | 130 |
| 3.2.3.4. | ATS3 - Command Line Termination Character | 131 |
| 3.2.3.5. | ATS4 - Response Formatting Character | 133 |
| 3.2.3.6. | ATS5 - Command Line Editing Character | 135 |
| 3.2.3.7. | ATS7 - Connection Completion Time-Out | 136 |
| 3.2.3.8. | ATS12 - Escaper Prompt Delay | 137 |
| 3.2.3.9. | ATS25 - Delay to DTR Off | 139 |
| 3.2.3.10. | AT&V1 - S Registers Display | 141 |
| 3.2.3.11. | ATS10 - Carrier Off with Firm Time | 143 |

| | | |
|-----------|---|-----|
| 3.2.3.12. | AT&V3 - Extended S Registers Display | 144 |
| 3.2.4. | DTE - Modem Interface Control | 145 |
| 3.2.4.1. | ATE - Command Echo | 145 |
| 3.2.4.2. | ATQ - Quiet Result Codes | 146 |
| 3.2.4.3. | ATV - Response Format | 148 |
| 3.2.4.4. | ATI - Identification Information | 150 |
| 3.2.4.5. | AT&C - Data Carrier Detect (DCD) Control | 151 |
| 3.2.4.6. | AT&D - Data Terminal Ready (DTR) Control | 152 |
| 3.2.4.7. | AT&K - Flow Control | 153 |
| 3.2.4.8. | AT&S - Data Set Ready (DSR) Control | 154 |
| 3.2.4.9. | AT+IPR - UART DCE Interface Data Rate Speed | 155 |
| 3.2.4.10. | AT#DTR - Data Terminal Ready (DTR) flow control | 157 |
| 3.2.4.11. | AT+IFC - DTE-Modem Local Flow Control | 160 |
| 3.2.4.12. | AT+ICF - DTE-Modem Character Framing | 162 |
| 3.2.4.13. | AT#SKIPESC - Skip Escape Sequence | 164 |
| 3.2.4.14. | AT#SETHXSTR - Enable Input of Hex Coded Characters in String Constants 166 | |
| 3.2.4.15. | AT#E2ESC - Escape Sequence Guard Time | 168 |
| 3.2.4.16. | ATX - Extended Result Codes | 169 |
| 3.2.5. | Call (Voice and Data) Control | 171 |
| 3.2.5.1. | ATD - Dialup Connection | 171 |
| 3.2.5.2. | ATA - Answer Incoming call | 175 |
| 3.2.5.3. | ATH - Hang Up/Disconnect the Current Call | 176 |
| 3.2.5.4. | ATO - Return to ON-Line Mode | 177 |
| 3.2.5.5. | AT#ATDCECHECK - ATD CE Level Check | 178 |
| 3.2.5.6. | AT#DIALMODE - Set Dialing Mode | 180 |
| 3.2.6. | Modulation & Compression Control | 182 |
| 3.2.6.1. | AT%E - Line Quality and Auto Retrain | 182 |
| 3.3. | Network | 183 |
| 3.3.1. | AT+CNUM - Subscriber Number | 183 |
| 3.3.2. | AT+COPN - Read Operator Names | 185 |
| 3.3.3. | AT+CREG - Network Registration Status | 187 |

| | | |
|---------|---|-----|
| 3.3.4. | AT+COPS - Operator Selection | 190 |
| 3.3.5. | AT+CLCK - Facility Lock/Unlock | 194 |
| 3.3.6. | AT+CPWD - Change Facility Password | 197 |
| 3.3.7. | AT+CLIR - Calling Line Identification Restriction | 199 |
| 3.3.8. | AT+CLCC - List Current Calls | 202 |
| 3.3.9. | AT+CPOL - Preferred Operator List | 205 |
| 3.3.10. | AT+CPLS - Selection of Preferred PLMN List | 208 |
| 3.3.11. | AT+CSQ - Signal Quality | 210 |
| 3.3.12. | AT#SERVINFO - Serving Cell Information | 213 |
| 3.3.13. | AT#BCCHLOCK - Lock to Single BCCH ARFCN | 216 |
| 3.3.14. | AT#NWEN - Network Emergency Number Update | 218 |
| 3.3.15. | AT#PLMNUPDATE - Update PLMN List | 220 |
| 3.3.16. | AT#PLMNMODE - PLMN List Selection | 222 |
| 3.3.17. | AT#FPLMN - Periodical FPLMN Cleaning | 223 |
| 3.3.18. | AT#BND - Select Band | 225 |
| 3.3.19. | AT#BNDPRIEXT - Band Priority Setting | 229 |
| 3.3.20. | AT#AUTOBND - Automatic Band Selection | 231 |
| 3.3.21. | AT#ATUNERSEL - Select Antenna Tuner | 232 |
| 3.3.22. | AT#BNDTUNER - Antenna Tuner Configuration | 234 |
| 3.3.23. | AT#SNUM - Subscriber Number | 238 |
| 3.3.24. | AT#CODECINFO - Codec Information | 240 |
| 3.3.25. | AT#CEERNET - Extended Numeric Error Report for Network Reject Cause | 246 |
| 3.3.26. | AT#CEERNETEXT - Extended Error Report for Network Reject Cause | 251 |
| 3.3.27. | AT#CIPHIND - Cipherring Indication | 254 |
| 3.3.28. | AT#PSNT - Packet Service Network Type | 256 |
| 3.3.29. | AT#ENCALG - Set Encryption Algorithm | 258 |
| 3.3.30. | AT+CEMODE - Set Mode of Operation for EPS | 262 |
| 3.3.31. | AT+CESQ - Extended Signal Quality | 264 |
| 3.3.32. | AT#ENS - Enhanced Network Selection | 267 |
| 3.3.33. | AT+WS46 - PCCA STD-101 Select Wireless Network | 269 |
| 3.3.34. | AT+CEDRXS - eDRX Setting | 271 |

| | | |
|---------|---|-----|
| 3.3.35. | AT+CEDRXRDP - eDRX Read Dynamic Parameters | 275 |
| 3.3.36. | AT+CEREG - EPS Network Registration Status | 277 |
| 3.3.37. | AT#CPSMSCFG - PSM State Configuration | 280 |
| 3.3.38. | AT#RFSTS - Read Current Network Status | 282 |
| 3.3.39. | AT#SPN - Read SIM Field SPN | 287 |
| 3.3.40. | AT#CEDRXS - Extended eDRX Setting | 288 |
| 3.3.41. | AT#MONI - Cell Monitor | 293 |
| 3.3.42. | AT#LTESFN - LTE Frame Information | 299 |
| 3.3.43. | AT+CRCES - Reading Coverage Enhancement Status | 300 |
| 3.3.44. | AT#SNRSET - SNR Set Level | 302 |
| 3.3.45. | AT#IOTBND - CAT-M1 & NB-IoT Band Setting | 303 |
| 3.3.46. | AT#IRATTIMER - Inter RAT Timer Setting | 305 |
| 3.3.47. | AT#NB2ENA - Enable/Disable NB2 mode | 307 |
| 3.3.48. | AT+CLIP - Calling Line Identification Presentation | 308 |
| 3.3.49. | AT#WS46 - Select IoT Technology | 311 |
| 3.4. | SIM | 313 |
| 3.4.1. | AT+CPIN - Enter the PIN | 313 |
| 3.4.2. | AT#PCT - Display PIN Counter | 317 |
| 3.4.3. | AT+CCID - Read ICCID | 319 |
| 3.4.4. | AT+CIMI - International Mobile Subscriber Identity (IMSI) | 320 |
| 3.4.5. | AT#CIMI - International Mobile Subscriber Identity (IMSI) | 321 |
| 3.4.6. | AT#SIMDET - SIM Detection Mode | 322 |
| 3.4.7. | AT#SIMPR - SIM Presence Status | 325 |
| 3.4.8. | AT#CCID - Read ICCID | 327 |
| 3.4.9. | AT#QSS - Query SIM Status | 328 |
| 3.4.10. | AT+CRSM - Restricted SIM access | 330 |
| 3.4.11. | AT+CSIM - Generic SIM Access | 334 |
| 3.4.12. | AT+CCHO - Open Logical Channel | 337 |
| 3.4.13. | AT+CCHC - Close Logical Channel | 339 |
| 3.4.14. | AT+CGLA - Generic UICC Logical Channel Access | 340 |
| 3.4.15. | AT#VSIMSETPROF - Set Virtual SIM profile | 342 |
| 3.4.16. | AT#VSIMSTAT - Display general details of VSIM | 344 |

| | | |
|---------|--|-----|
| 3.4.17. | AT#VSIMVER - Get SIM version | 346 |
| 3.4.18. | AT+ICCID - Read ICCID | 347 |
| 3.4.19. | AT#SIMINCFG - SIMIN Pin Configuration | 348 |
| 3.4.20. | AT#SIMSELGPIOCFG - SIM Select | 351 |
| 3.4.21. | AT#FWAUTOSIM - Automatic Switch of Firmware Image by SIM | 352 |
| 3.4.22. | AT#FIRSTNET - APN Automatic Switch by SIM | 354 |
| 3.5. | SIM Toolkit | 356 |
| 3.5.1. | AT#STIA - SIM/USIM Toolkit Interface Action | 356 |
| 3.5.2. | AT#STGI - SIM Toolkit Get Information | 363 |
| 3.5.3. | AT#STSR - SIM Toolkit Send Response | 375 |
| 3.6. | SMS & CB | 379 |
| 3.6.1. | AT+CSMS - Select Message Service | 379 |
| 3.6.2. | AT+CPMS - Preferred Message Storage | 382 |
| 3.6.3. | AT+CMGF - Message Format | 385 |
| 3.6.4. | AT+CSCA - Service Center Address | 387 |
| 3.6.5. | AT+CSMP - Set Text Mode Parameters | 389 |
| 3.6.6. | AT+CSDH - Show Text Mode Parameters | 391 |
| 3.6.7. | AT+CSAS - Save Settings | 393 |
| 3.6.8. | AT+CRES - Restore Settings | 395 |
| 3.6.9. | AT+CMMS - More Message to Send | 397 |
| 3.6.10. | AT+CNMI - New Message Indications to Terminal Equipment | 399 |
| 3.6.11. | AT+CNMA - New Message Acknowledgement | 407 |
| 3.6.12. | AT+CMGL - List Messages | 412 |
| 3.6.13. | AT+CMGR - Read Message | 418 |
| 3.6.14. | AT+CMGS - Send Short Message | 424 |
| 3.6.15. | AT+CMSS - Send Message from Storage | 429 |
| 3.6.16. | AT+CMGW - Write Short Message to Memory | 431 |
| 3.6.17. | AT+CMGD - Delete Message | 437 |
| 3.6.18. | AT+CGSMS - Select Service for MO SMS Messages | 439 |
| 3.6.19. | AT#SMSMODE - SMS Commands Operation Mode | 441 |
| 3.6.20. | AT#SMSRETRY - SMS Retry | 443 |

| | | |
|----------|--|-----|
| 3.6.21. | AT#CMGLCONCINDEX - Report Concatenated SMS Indexes | 444 |
| 3.6.22. | AT#E2SMSRI - SMS Ring Indicator | 446 |
| 3.6.23. | AT#SMOV - SMS Overflow | 448 |
| 3.6.24. | AT#SMSMOVE - Move Short Message to other Memory | 450 |
| 3.7. | Phonebook | 453 |
| 3.7.1. | AT+CPBS - Select Phonebook Memory Storage | 453 |
| 3.7.2. | AT+CPBR - Read Phonebook Entries | 456 |
| 3.7.3. | AT+CPBF - Find Phonebook Entries | 460 |
| 3.7.4. | AT+CPBW - Write Phonebook Entry | 464 |
| 3.7.5. | AT#CPBGR - Read Group Entries | 468 |
| 3.7.6. | AT#CPBGW - Write Group Entry | 471 |
| 3.7.7. | AT#CPBD - Delete All Phonebook Entries | 473 |
| 3.8. | Time & Alarm | 474 |
| 3.8.1. | AT+CCLK - Clock Management | 474 |
| 3.8.2. | AT+CALA - Alarm Management | 476 |
| 3.8.3. | AT+CAPD - Postpone Alarm | 482 |
| 3.8.4. | AT+CSDF - Setting Date Format | 483 |
| 3.8.5. | AT+CTZR - Time Zone Reporting | 486 |
| 3.8.6. | AT+CTZU - Automatic Time Zone Update | 488 |
| 3.8.7. | AT#NITZ - Network Identity and Time Zone | 490 |
| 3.8.8. | AT#CCLK - Clock Management | 493 |
| 3.8.9. | AT#CCLKMODE - Clock Mode | 495 |
| 3.8.10. | AT#WAKE - Wake from Alarm Mode | 497 |
| 3.8.11. | AT+CSTF - Setting Time Format | 499 |
| 3.8.12. | AT+CALD - Delete Alarm | 501 |
| 3.9. | Audio | 502 |
| 3.9.1. | Audio Basic Configuration | 502 |
| 3.9.1.1. | AT+CRSL - Ringer Sound Level | 502 |
| 3.9.1.2. | AT+CLVL - Loudspeaker Volume Level | 504 |
| 3.9.1.3. | AT+CMUT - Microphone Mute Control | 506 |
| 3.9.1.4. | AT#ACDB - Audio Configuration | 508 |
| 3.9.1.5. | AT#OAP - Open Audio Loop | 510 |

| | | |
|----------|--|-----|
| 3.9.2. | Embedded DTMF Decoder & TTY | 512 |
| 3.9.2.1. | AT#DTMF - Embedded DTMF Decoder Enabling | 512 |
| 3.9.3. | Digital Voice Interface | 514 |
| 3.9.3.1. | AT#DVI - Digital Voiceband Interface | 514 |
| 3.10. | HW and Radio Control | 516 |
| 3.10.1. | AT#CBC - Battery and Charger Status | 516 |
| 3.10.2. | AT#TEMPCFG - Temperature Monitor Configuration | 518 |
| 3.10.3. | AT#GPIO - General Purpose Input/Output Pin Control | 526 |
| 3.10.4. | AT#ALARMPIN - Alarm Pin Configuration | 532 |
| 3.10.5. | AT#SLED - STAT_LED GPIO Setting | 534 |
| 3.10.6. | AT#SLEDSAV - Save STAT_LED GPIO Setting | 537 |
| 3.10.7. | AT#ADC - Read Analog/Digital Converter Input | 538 |
| 3.10.8. | AT#V24CFG - V24 Output Pins Configuration | 540 |
| 3.10.9. | AT#V24 - V24 Output Pins Control | 542 |
| 3.10.10. | AT#I2CWR - Write to I2C | 544 |
| 3.10.11. | AT#I2CRD - Read from I2C | 546 |
| 3.10.12. | AT#I2CCF - Combined Format for I2C Writing and Reading | 548 |
| 3.10.13. | AT#TEMPMON - Temperature Monitor | 551 |
| 3.10.14. | AT#TESTMODE - Test Mode Configuration | 555 |
| 3.11. | Power Down | 562 |
| 3.11.1. | AT#REBOOT - Module Reboot | 562 |
| 3.11.2. | AT#ENHRST - Periodic Reset | 563 |
| 3.11.3. | AT#SHDN - Software Shutdown | 565 |
| 3.11.4. | AT#SYSHALT - System Turn-Off | 566 |
| 3.11.5. | AT#FASTSHDN - Fast Shutdown Configuration | 568 |
| 3.11.6. | AT#DGEN - Dying GASP Configuration | 570 |
| 3.12. | Easy Scan | 576 |
| 3.12.1. | AT#CSURV - Network Survey | 576 |
| 3.12.2. | AT#CSURVC - Network Survey (Numeric Format) | 583 |
| 3.12.3. | AT#CSURVF - Network Survey Format | 587 |
| 3.12.4. | AT#CSURVNLf - Network Survey CR LF Removing | 589 |
| 3.12.5. | AT#CSURVEXT - Extended Network Survey | 590 |

| | | |
|----------|---|-----|
| 3.13. | Jamming Detection and Report | 591 |
| 3.13.1. | AT#JDRENH2 - Enhanced Jamming Detection and Report | 591 |
| 3.13.2. | AT#JDR4GCFG - LTE Jamming Detection Threshold Configuration | 596 |
| 3.14. | Packet Domain | 599 |
| 3.14.1. | AT+CGDCONT - Define PDP Context | 599 |
| 3.14.2. | AT+CGPADDR - Show PDP Address | 603 |
| 3.14.3. | AT#AUTOATT - Auto-Attach Property | 605 |
| 3.14.4. | AT#BSRCFG - Buffer Status Reporting (BSR) Configuration | 606 |
| 3.14.5. | AT#MSCCLASS - Multislot Class Control | 607 |
| 3.14.6. | AT#GAUTH - PPP Data Connection Authentication Type | 609 |
| 3.14.7. | AT+CGAUTH - Define PDP Context Authentication Parameters | 611 |
| 3.14.8. | AT+CGCONTRDP - PDP Context Read Dynamic Parameters | 613 |
| 3.14.9. | AT+CGPIAF - Printing IP Address Format | 616 |
| 3.14.10. | AT+CGACT - PDP Context Activate or Deactivate | 619 |
| 3.14.11. | AT+CGEREP - Packet Domain Event Reporting | 621 |

1. INTRODUCTION

1.1. Scope

This document is aimed to provide a detailed specification and a comprehensive listing for reference for the entire AT command set.

1.2. Audience

Readers of this document should be familiar with Telit modules and their ease of controlling by means of AT Commands.

1.3. Contact Information, Support

For general contacts, technical support services, technical questions and report of documentation errors, contact Telit Technical Support at:

1. TS-EMEA@telit.com
2. TS-AMERICAS@telit.com
3. TS-APAC@telit.com
4. TS-SRD@telit.com
5. TS-ONEEDGE@telit.com

Alternatively, use:

<https://www.telit.com/contact-us/>

For detailed information about where you can buy the Telit modules or for recommendations on accessories and components visit:

<https://www.telit.com>

Our aim is to make this guide as helpful as possible. Keep us informed of your comments and suggestions for improvements.

Telit appreciates the user feedback on our information

1.4. Symbol Convention

Danger: This information **MUST** be followed or catastrophic equipment failure or personal injury may occur.

Warning: Alerts the user on important steps about the module integration. If these points are not followed, the module and end user equipment may fail or malfunction.

Note/Tip: This section provides all information related to the AT command involved. Each note can provide a different level of information: danger, caution/warning and tip/information.

Note/Tip: Provides other advices and suggestions.

Note/Tip: Provides advice and suggestions that may be useful when integrating the module.

Electro-static Discharge: Notifies the user to take proper grounding precautions before handling the product.

Set: This section provides all information related to SET functionality of the AT command involved. If there is strictly and relevant SET information, it can be found at the end of the section.

Read: This section provides all information related to READ functionality of the AT command involved. If there is strictly and relevant READ information, it can be found at the end of the section.

Test: This section provides all information related to TEST functionality of the AT command involved. If there is strictly and relevant TEST information, these can be found at the end of the section.

Additional info: This section provides any kind of additional and useful information related to the AT command section as well as command exceptions or special behavior cases

Reference: This section provides useful references (standards or normative) related to the AT command involved.

Example: This section provides useful examples related to the AT command involved.

Table 1: Symbol Conventions

All dates are in ISO 8601 format, that is. YYYY-MM-DD.

2. COMMANDS

The Telit family of wireless modules can be controlled via the serial interface using the standard AT commands1F1F. It complies with:

1. Hayes standard AT command set, to maintain the compatibility with existing SW programs.
2. 3GPP TS 27.007 specific AT command and GPRS specific commands.
3. 3GPP TS 27.005 specific AT commands for SMS (Short Message Service) and CBS (Cell Broadcast Service)

Moreover, the Telit family of wireless modules also supports Telit's proprietary AT commands for special purposes.

The following is a description of how to use the AT commands with the Telit family of wireless modules.

Note: The AT is an ATTENTION command and is used as a prefix to other parameters in a string. The AT command combined with other parameters can be set up in the communications package or typed in manually as a command line instruction combined with other parameters can be set up in the communications package or typed in manually as a command line instruction.

2.1. Definitions

The following syntactic definitions apply:

- <CR> **Carriage return character**, is the command line and terminator character of the result code, whose value, in decimal ASCII between 0 and 255, is specified within the parameter **S3**. The default value is 13.
- <LF> **Linefeed character**, is the character recognized as line feed character. Its value, in decimal ASCII between 0 and 255, is specified within parameter **S4**. The default value is 10. The line feed character is output after the carriage return character if detailed result codes are used (**V1** option used) otherwise, if numeric format result codes are used (**V0** option used) it will not appear in the result codes.
- <...> Name enclosed in angle brackets is a syntactic element. They are not displayed on the command line.
- [...] The optional sub parameter of a command or an optional part of the TA information response is enclosed in square brackets. The brackets themselves are not

displayed on the command line. When the sub parameter is not given in AT commands that have a Read command, new value is equal to its previous value. In AT commands that do not store the values of any of their sub parameters, and therefore do not have a Read command, which are called *action type* commands, an action should be performed according to the recommended default setting of the sub parameter.

2.2. AT Command Syntax

The syntax rules followed by Telit implementation of either Hayes AT commands, GSM commands are very similar to those of standard basic and extended AT commands

There are two types of extended command:

1. **Parameter type commands.** This type of commands may be "set" (to store a value or values for later use), "read" (to determine the current value or stored values), or "tested" (to determine ranges of values supported). Each of them has a test command (trailing =?) to provide information about the type of its sub parameters; they also have a Read command (trailing?) to check the current values of sub parameters.
2. **Action type commands.** This type of command may be "executed" or "tested".
 1. "executed" to invoke a function of the equipment, which generally involves more than the simple storage of a value for later use
 2. "tested" to determine:
 1. if sub parameters are associated with the action, the ranges of sub parameters values that are supported; if the command has no sub parameters, issuing the correspondent Test command (trailing =?) raises the result code "ERROR".
Note: issuing the Read command (trailing?) causes the command to be executed.
 2. whether the equipment implements the Action Command or not (in this case issuing the correspondent Test command - trailing =? - returns the OK result code), and, if sub parameters are associated with the action, the ranges of sub parameters values that are supported.

Action commands do not store the values of any of their possible sub parameters.

Moreover:

The response to the Test Command (trailing =?) may be modified in the future by Telit to allow for the description of new values/functionalities.

If all the sub parameters of a parameter type command **+CMD** are optional, issuing **AT+CMD=<CR>** causes the result code to be returned to **OK** and the previous values of the omitted sub parameters to be retained.

2.2.1. String Type Parameters

A string, either enclosed between quotes or not, is a valid string type parameter input. According to V25.ter space characters are ignored on the command line and may be used freely for formatting purposes, unless they are embedded in numeric or quoted string constants; therefore a string containing a space character must be enclosed between quotes to be considered a valid string type parameter (e.g. typing **AT+COPS=1,0,"A1"** is the same as typing **AT+COPS=1,0,A1**; typing **AT+COPS=1,0,"A BB"** is different from typing **AT+COPS=1,0,A BB**).

A string is always case-sensitive.

A small set of commands always requires to write the input string parameters in quotes: this is explicitly reported in the specific descriptions.

2.2.2. Command Lines

A command line is made up of three elements: the **prefix**, the **body** and the **termination character**.

The **command line prefix** consists of the characters "AT" or "at", or, to repeat the execution of the previous command line, the characters "A/" or "a/" or **AT#/#** or **at#/#**.

The **termination character** may be selected by a user option (parameter S3), the default being **<CR>**.

The basic structures of the command line are:

1. **ATCMD1<CR>** where **AT** is the command line prefix, **CMD1** is the body of a **basic command** (nb: the name of the command never begins with the character "+") and **<CR>** is the command line terminator character
2. **ATCMD2=10<CR>** where 10 is a sub parameter
3. **AT+CMD1;+CMD2=, ,10<CR>** These are two examples of **extended commands** (nb: the name of the command always begins with the character "+"). They are delimited by semicolon. In the second command the sub parameter is omitted.

Note: The set of proprietary AT commands differs from the standard one because the name of each of them begins with either "@", "#", "\$" or "*". Proprietary AT commands follow the same syntax rules as extended commands.

1. **+CMD1?<CR>** This is a Read command for checking current sub parameter values
2. **+CMD1=?<CR>** This is a test command for checking possible sub parameter values

These commands might be performed in a single command line as shown below:

```
ATCMD1 CMD2=10+CMD1;+CMD2=,10;+CMD1?;+CMD1=?<CR>
```

however, it is always preferable to separate basic and extended commands in different command lines; furthermore, it is recommended to avoid placing several action commands in the same command line, because if one of them fails, then an error message is received but it is not possible to claim which one of them has failed the execution.

If command **V1** is enabled (detailed responses codes) and all commands in a command line have been performed successfully, the result code **<CR><LF>OK<CR><LF>** is sent from the TA to the TE, if sub parameter values of a command are not accepted by the TA or the command itself is invalid, or the command cannot be executed for some reason, result code **<CR><LF>ERROR<CR><LF>** is sent and no subsequent commands in the command line are processed.

If command **V0** is enabled (numeric responses codes), and all commands in a command line has been executed successfully, the result code **0<CR>** is sent from the TA to the TE, if sub-parameter values of a command are not accepted by the TA or the command itself is invalid, or command cannot be executed for some reason, result code **4<CR>** and no subsequent commands in the command line are processed.

In case of errors depending on ME operation, **ERROR** (or **4**) response may be replaced by **+CME ERROR: <err>** or **+CMS ERROR: <err>**.

Note: The command line buffer accepts a maximum of 400 characters. If this number is exceeded, none of the commands will be executed and TA returns **ERROR**.

2.2.2.1. ME Error Result Code - +CME ERROR: <err>

This is NOT a command; it is the error response to **+Cxxx** 3GPP TS 27.007 commands.

Syntax: **+CME ERROR: <err>**

Parameter: **<err>** - error code can be either numeric or detailed (see **+CMEE**). The possible values of **<err>** are reported in the table:

Note: "Numeric Format" Not all modules support the error codes shown in the table

Note: "Verbose Format" There could be small variations in the message depending on the module in use

| Numeric Format | Verbose Format |
|----------------|-----------------------------|
| 0 | phone failure |
| 1 | no connection to phone |
| 2 | phone adaptor link reserved |
| 3 | operation not allowed |
| 4 | operation not supported |
| 5 | PH-SIM PIN required |
| 6 | PH-FSIM PIN required |
| 7 | PH-FSIM PUK required |
| 10 | SIM not inserted |
| 11 | SIM PIN required |
| 12 | SIM PUK required |
| 13 | SIM failure |
| 14 | SIM busy |
| 15 | SIM wrong |
| 16 | incorrect password |
| 17 | SIM PIN2 required |
| 18 | SIM PUK2 required |

| Numeric Format | Verbose Format |
|----------------|---|
| 20 | memory full |
| 21 | invalid index |
| 22 | not found |
| 23 | memory failure |
| 24 | text string too long |
| 25 | invalid characters in text string |
| 26 | dial string too long |
| 27 | invalid characters in dial string |
| 30 | no network service |
| 31 | network timeout |
| 32 | network not allowed - emergency calls only |
| | |
| 34 | numeric parameter instead of text parameter |
| 35 | text parameter instead of numeric parameter |
| 36 | numeric parameter out of bounds |
| 37 | text string too short |
| 38 | The GPIO Pin is already used |
| | |
| 40 | network personalization PIN required |
| 41 | network personalization PUK required |
| 42 | network subset personalization PIN required |
| 43 | network subset personalization PUK required |
| 44 | service provider personalization PIN required |
| 45 | service provider personalization PUK required |
| 46 | corporate personalization PIN required |
| 47 | corporate personalization PUK required |
| 49 | EAP method not supported |

| Numeric Format | Verbose Format |
|----------------|--|
| 50 | Invalid EAP parameter |
| 51 | Parameter length error for all Auth commands |
| 52 | Temporary error for all Auth command |
| | |
| 53 | not verified hidden key |
| | |
| 100 | unknown |
| 103 | Illegal MESSAGE |
| 106 | Illegal ME |
| 107 | GPRS services not allowed |
| 111 | PLMN not allowed |
| 112 | Location area not allowed |
| 113 | Roaming not allowed in this location area |
| 132 | service option not supported |
| 133 | requested service option not subscribed |
| 134 | service option temporarily out of order |
| 148 | unspecified GPRS error |
| 149 | PDP authentication failure |
| 150 | invalid mobile class |
| | |
| 257 | network rejected request |
| 258 | retry operation |
| 259 | invalid deflected to number |
| 260 | deflected to own number |
| 261 | unknown subscriber |
| 262 | service not available |
| 263 | unknown class |

| Numeric Format | Verbose Format |
|----------------|-----------------------------------|
| 264 | unknown network message |
| | |
| 273 | Minimum TFT per PDP address error |
| 274 | Duplicate TFT eval prec index |
| 275 | Invalid TFT param combination |
| | |
| 277 | Invalid number of parameters |
| 278 | Invalid Parameter |
| | |
| 320 | Call index error |
| 321 | Call state error |
| 322 | Sys state error |
| 323 | Parameters error |
| | |
| 550 | generic undocumented error |
| 551 | wrong state |
| 552 | wrong mode |
| 553 | context already activated |
| 554 | stack already active |
| 555 | activation failed |
| 556 | context not opened |
| 557 | can not setup socket |
| 558 | can not resolve DN |
| 559 | time-out in opening socket |
| 560 | can not open socket |
| 561 | remote disconnected or time-out |
| 562 | connection failed |

| Numeric Format | Verbose Format |
|----------------|-----------------------------------|
| 563 | tx error |
| 564 | already listening |
| 565 | socket disconnection |
| 566 | can not resume socket |
| 567 | ip version type incompatible |
| 568 | ipv6 not enabled |
| | |
| 569 | |
| | |
| 600 | Generic undocumented error |
| 601 | wrong state |
| 602 | Can not activate |
| 603 | Can not resolve name |
| 604 | Can not allocate control socket |
| 605 | Can not connect control socket |
| 606 | Bad or no response from server |
| 607 | Not connected |
| 608 | Already connected |
| 609 | Context down |
| 612 | Resource used by other instance |
| | |
| 613 | Data socket yet opened in cmdmode |
| 614 | FTP CmdMode data socket closed |
| 615 | FTP not connected |
| 616 | FTP disconnected |
| 617 | FTP read command closed |
| 618 | FTP read command error |

| Numeric Format | Verbose Format |
|----------------|--------------------------------------|
| 619 | FTP write command closed |
| 620 | FTP write command error |
| 621 | FTP read data closed |
| 622 | FTP read data error |
| 623 | FTP write data closed |
| 624 | FTP write data error |
| 625 | FTP host not found |
| 626 | FTP accept failure |
| 627 | FTP listen failure |
| 628 | FTP bind failure |
| 629 | FTP file create failure |
| 630 | FTP file get failure |
| 631 | FTP file put failure |
| 632 | FTP file not found |
| 633 | FTP timed out |
| 634 | FTP login incorrect |
| 635 | FTP close error |
| 636 | FTP server not ready |
| 637 | FTP server shutdown |
| 638 | FTP unexpected reply |
| 639 | FTP user ID and password don't match |
| 640 | FTP user ID and password don't match |
| 641 | FTP user already logged in |
| 642 | FTP open channel timeout |
| 643 | FTP communication timeout |
| 644 | FTP unknown error |
| | |

| Numeric Format | Verbose Format |
|----------------|--|
| 657 | Network survey error (No Carrier) |
| 658 | Network survey error (Busy) |
| 659 | Network survey error (Wrong request) |
| 660 | Network survey error (Aborted) |
| | |
| 680 | LU processing |
| 681 | Network search aborted |
| 682 | PTM mode |
| 683 | Network search terminated |
| 684 | CSG Search processing |
| | |
| 690 | Active call state |
| 691 | RR connection established |
| 770 | SIM invalid |
| 900 | No Response for AT Command |
| | |
| 1000 | SSL not activated |
| 1001 | SSL certs and keys wrong or not stored |
| 1002 | SSL generic error |
| 1003 | SSL already activated |
| 1004 | SSL error during handshake |
| 1005 | SSL socket error |
| 1006 | SSL invalid state |
| 1007 | SSL cannot activate |
| 1008 | SSL not connected |
| 1009 | SSL already connected |
| 1010 | SSL error enc/dec data |

| Numeric Format | Verbose Format |
|----------------|-----------------------------|
| 1011 | SSL disconnected |
| | |
| 1100 | Model not recognized |
| 1101 | Model information missing |
| | |
| 1102 | Unable to open the file |
| 1103 | Unable to close the file |
| | |
| 1104 | Unable to read the nv file |
| 1105 | Unable to write the nv file |
| 1106 | Input pattern is wrong |
| | |
| 1113 | Call establishment failed |
| 1114 | File name already exist |

Table 2:

2.2.2.2. Message Service Failure Result Code - +CMS ERROR: <err>

This is NOT a command; it is the error response to +Cxxx 3GPP TS 27.005 commands.

Syntax: **+CMS ERROR: <err>**

Parameter: **<err>** - numeric error code.

The **<err>** values are reported in the table:

| Numeric Format | Meaning |
|--|---------|
| According to 3GPP TS 24.011 section 8.2.5.4 | |
| 0...127 | |
| According to 3GPP TS 23.040 sub clause 9.2.3.22 values | |
| 128...255 | |
| According to 3GPP TS 27.005 section 3.2.5 - Message Service Failure Result Code +CMS ERROR | |

| Numeric Format | Meaning |
|---|-----------------------------------|
| 300 | ME failure |
| 301 | SMS service of ME reserved |
| 302 | operation not allowed |
| 303 | operation not supported |
| 304 | invalid PDU mode parameter |
| 305 | invalid text mode parameter |
| 310 | SIM not inserted |
| 311 | SIM PIN required |
| 312 | PH-SIM PIN required |
| 313 | SIM failure |
| 314 | SIM busy |
| 315 | SIM wrong |
| 316 | SIM PUK required |
| 317 | SIM PIN2 required |
| 318 | SIM PUK2 required |
| 320 | memory failure |
| 321 | invalid memory index |
| 322 | memory full |
| 330 | SMSC address unknown |
| 331 | no network service |
| 332 | network time-out |
| 340 | no +CNMA acknowledgement expected |
| 500 | unknown error |
| 510 | msg blocked |
| <err> 512 and on are manufacturer specific | |
| 512 | No SM resources |
| 513 | TR1M timeout |

| Numeric Format | Meaning |
|----------------|--------------------------|
| 514 | LL error |
| 515 | No response from network |

Table 3:

2.2.2.3. Carriage Returns, Line Feeds and Log

Generally, the number of carriage returns **<CR>** and line feeds **<LF>** at the end of command responses may vary. This scenario may also vary from software version to software version. We do not have evidence of this behavior in URC lines.

Command responses examples:

AT#LWM2MMON?<CR>

<CR><LF>

#LWM2MMON: "4"<LF>#LWM2MMON: "3"  missing **<CR>**

<CR><LF>

<CR><LF>

OK

<CR><LF>

AT#LWM2MNFYACKURI=0,2<CR>

<CR><LF>

#LWM2MNFYACKURI: "/3/0/9"<LF>#LWM2MNFYACKURI: "/3/0/8"  missing **<CR>**

<CR><LF>

<CR><LF>

OK

<CR><LF>

The user must be aware of this aspect before writing a script to parse the command lines and the relative response lines to generate a log.

2.2.3. Information Responses and Result Codes

The TA response, in case of verbose response format enabled, for the previous examples command line could be as shown below:

1. information response to **+CMD1?**
<CR><LF>+CMD1:2,1,10<CR><LF>
2. information response to **+CMD1=?**
<CR><LF>+CMD1(0-2),(0,1),(0-15)<CR><LF>
3. result code **<CR><LF>OK<CR><LF>**

Moreover, there are two other types of result codes:

1. *result codes* that inform about the progress of the TA operation (e.g. connection establishment **CONNECT**)
2. *result codes* that indicate the occurrence of an event not directly associated with the issuance of a command from TE (e.g. ring indication **RING**).

Here the basic result codes according to ITU-T V25Ter recommendation

| Numeric form | Verbose form |
|--------------|-------------------------------|
| 0 | OK |
| 1 | CONNECT or CONNECT <text>3F3F |
| 2 | RING |
| 3 | NO CARRIER |
| 4 | ERROR |
| 6 | NO DIALTONE |
| 7 | BUSY |
| 8 | NO ANSWER |
| 10 | CONNECT 24004 |
| 11 | CONNECT 48004 |
| 12 | CONNECT 96004 |
| 15 | CONNECT 144004 |
| 23 | CONNECT 1200/754 |

Table 4:

Note: <text> can be "300", "1200", "2400", "4800", "9600", "14400" or "1200/75"

2.2.4. Command Response Time-Out

Every command issued to the Telit modules returns a result response, if response codes are enabled (default). The time required to process the given command and return the response varies, depending on the command type. The Commands that do not interact with the SIM or the network, and only involve internal setups or readings, have an immediate response. The Commands that interact with the SIM or the network may take several seconds to send a response, depending on the SIM configuration (for example,

number of contacts stored in the phonebook, number of stored SMS), or on the network the command may interact with.

2.2.5. Command Issuing Timing

The chain Command -> Response must always be respected, and a new command must not be issued before the module has finished all the ending of the response result code (whatever it is).

This applies especially to applications that "sense" the **OK** text and therefore may send the next command before the complete code `<CR><LF>OK<CR><LF>` is sent by the module.

However, It is advisable to wait for at least 20ms between the end of the reception of the response and the issue of the next AT command.

If the response codes are disabled and therefore the module does not report any response to the command, then at least the 20ms pause time must be respected.

2.3. Storage

2.3.1. Factory Profile and User Profiles

The Telit wireless modules store the values, set by several commands, in the internal non-volatile memory (NVM), allowing to remember this setting even after power off. In NVM, these values are set either as factory or user profiles. There are two customizable user profiles and one factory profile in the NVM of the device: by default, the device will start with user profile 0 equal to the factory profile.

For backward compatibility, each profile is divided into two sections, one base section which was historically the one saved and restored in early releases of code, and the extended section which includes all remaining values.

The **&W** command is used to save the current values of both profile sections into the NVM user profile.

Commands **&Y** and **&P** are both used to set the profile to be loaded at startup. **&Y** instructs the device to load at startup only the base section. **&P** instructs the device to load at startup the full profile: base + extended sections.

The **&F** command resets to factory profile values only the command of the base section of profile, while the **&F1** resets to factory profile values the full set of base + extended section commands.

The values set by other commands are stored in NVM outside the profile: some of them are always stored, without issuing any **&W**, some others are stored by issuing specific commands (**+CSAS**, **#SLEDSAV**, **#SKTSAV**, **#ESAV**); all these values are read at power-up.

In this document, each AT command description begins with an "AT Command short overview table" in the following format:

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| / | see below | / | / | / |

Table 5:

This chapter focuses on the values that the **saved Setting** field can have and their meaning. The meaning of the other fields will be described in the next chapter. The **saved Setting** field can have one of the values listed below (for information about the AT instance introduced hereafter, see the reference section of the **#PORTCFG** command):

Specific profile the parameters values set by the command are stored in the profile base section. The stored values set is associated to the specific AT instance used to enter the command. It is a profile used by the specific AT instances.

Examples of the AT commands: **+IPR**, **E**, **Q**, **V**, **X**, **&Y**, etc.

The parameters values set by the command are stored in the profile extended section. The stored values set is associated to the specific AT instance used to enter the command. It is a profile used by the specific AT instance.

Examples of the AT commands: **+FCLASS**, **+CREG**, **+CLIP**, **#STIA**, etc.

Common profile the parameters values set by the command are stored in the profile extended section. The stored values set is not associated to the specific AT instance used to enter the command. It is a profile shared between the AT instances.

Examples of the AT commands: **+CALM**, **#E2SLRI**, **#DVI**, etc.

Auto the parameters values set by the command are automatically stored in NVM, without issuing any storing AT command, and regardless of the profile (unique values). The values are automatically restored at startup.

AT commands examples: **+COPS**, **+CGQREQ**, **#SCFG**, etc.

In some cases, the parameters values are stored in the file system.

AT commands examples: **#TEMPCFG**, **#TEMPMON**, etc.

Other

the parameters values set by the command are stored in NVM by issuing a specific command and regardless of the profile.

Examples of the AT commands:

#SLED setting is saved by **#SLEDSAV**

#BIQUADINEX setting is saved by **#PSAV**

etc.

2.4. AT Command Short Overview Table

As stated before, each AT command description begins with an "AT Command short overview table" having the following format:

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | / | No | - | 2 |

Table 6:

Here are the table fields meanings:

SIM Presence indicates if the AT command to be executed needs the SIM presence.

Can be aborted indicates if the AT command can be aborted during its execution.

MAX timeout indicates the time within which the command must be executed.

SELINT indicates on which AT interface type the AT command is available.

3. AT COMMANDS REFERENCES

3.1. Call & DTMF

3.1.1. AT+CHUP - Hang Up Call

This command cancels all active and held calls

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CHUP

Execution command cancels all active and held calls, also if a multi-party session is running

AT+CHUP=?

Test command returns the **OK** result code

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.1.2. AT#ECAM - Extended Call Monitoring

This command enables/disables the call monitoring function in the ME.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#ECAM=[<onoff>]

Set command enables/disables the call monitoring function in the ME.

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <onoff> | integer | 0 | Enables/disables the call monitoring function in the ME, that informs the user about call events (such as incoming call, connected, hang up) using the following unsolicited indication: |

#ECAM:

<ccid>,<ccstatus>,<calltype>,,,[<number>,<type>]

Values:

0 : disables call monitoring function

1 : enables call monitoring function

Unsolicited fields:

| Name | Type | Description |
|--------|---------|----------------|
| <ccid> | integer | call ID number |

<ccstatus> integer call status

Values:

0 : idle

1 : calling (MO)

2 : connecting (MO)

3 : active

6 : alerting (MT)

7 : busy

<calltype> integer call type indicator

Value:

1 : voice

<number> string called number (valid only if **<ccstatus>** is 1)

<type> string type of **<number>**

Values:

129 : national number

145 : international number

AT#ECAM?

Read command reports whether the extended call monitoring function is currently enabled or not, in the format:

#ECAM: <onoff>

AT#ECAM=?

Test command returns the list of supported values for **<onoff>**

Modules supporting the command

| | |
|----------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.1.3. AT+VTS - DTMF Tones Transmission

The command handles the transmission of DTMF tones.

3GPP TS 27.007
TIA IS-101

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+VTS=<dtmfChar>

Execution command allows the transmission of DTMF tones.

Parameter:

| Name | Type | Default | Description |
|------------|--------|---------|--|
| <dtmfChar> | string | - | an ASCII character in the set (0 - 9), #, *, (A-D). It allows the user to send a DTMF tones, with a duration that was defined through +VTD command. |

Warning: the **string Type** must be replaced with **char Type**.

AT+VTS=?

Test command provides the list of supported <dtmf>s in the format:
(list of supported <dtmf>s)

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.1.4. AT+VTD - Tone Duration

Set command sets the length of tones transmitted with **+VTS** command.

3GPP TS 27.007
TIA IS-101

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Required | Common profile | No | - | 2 |

AT+VTD=<duration>

Parameter:

| Name | Type | Default | Description |
|------------|---------|---------|--------------------|
| <duration> | integer | 0 | duration of a tone |

Values:

- 0 : the duration of every single tone is dependent on the network
- 1÷255 : duration of every single tone in 1/10 sec

AT+VTD?

Read command reports the current Tone Duration, in the format:

<duration>

AT+VTD=?

Test command provides the list of supported <duration>

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.2. General Control and Config

3.2.1. Command Line Prefixes

3.2.1.1. AT - Starting a Command Line

AT is the prefix used to start a command line.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT

The prefix **AT** is a two-character abbreviation ("ATtention"), always used to start a command line to be sent from TE to TA, with the only exception of AT#/ prefix. As a command, it can be issued just to test if the device is responding to AT commands.

3.2.1.2. A/ - Last Command Automatic Repetition

The command immediately executes the previously issued command or commands.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

A/

If the prefix **A/** is issued, the device immediately executes once again the body of the preceding command line. No editing is possible, and no termination character is necessary. A command line may be repeated multiple times through this mechanism, if desired.

If **A/** is issued before any command line has been executed, the preceding command line is assumed to have been empty (that results in an **OK** result code).

-  This command works only at fixed IPR.
-  The custom prefix **AT#/** has been defined: it causes the last command to be executed again too; but it does not need a fixed **+IPR**.

3.2.1.3. AT#/ - Repeat Last Command

The command immediately executes the previously issued command or commands.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#/ Microchip icon: A small red square with a white microchip symbol inside, pointing to the right.

If **AT#/ **is issued, the device immediately executes once again the body of the preceding command line. No editing is possible, and no termination character is necessary. A command line may be repeated multiple times through this mechanism, if desired.****

If **AT#/ **is issued before any command line has been executed, the preceding command line is assumed to have been empty (that results in an **OK** result code).****

-  This command is the same as **A/** but does not need a fixed **+IPR**.

3.2.2. Generic Modem Control

3.2.2.1. AT#SELINT - Select Interface Style

This command sets the AT command interface style.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SELINT=[<v>]

Set command sets the AT command interface style depending on parameter.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|----------------------------|
| <v> | integer | 2 | AT command interface style |

Value:

2 : standard AT parser

AT#SELINT?

Read command reports the current interface style in the format:

#SELINT: <v>

AT#SELINT=?

Test command reports the available range of values for parameter <v>.

3.2.2.2. AT&F - Set to Factory-Defined Configuration

Set configuration parameters to default values.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&F[<value>]

Execution command sets the configuration parameters to default values specified by manufacturer; it takes in consideration hardware configuration switches and other manufacturer-defined criteria.

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|---------------------|
| <value> | integer | 0 | parameters to reset |

Values:

- 0 : only the factory profile base section parameters are considered
- 1 : either the factory profile base section and the extended section are considered (full factory profile)

If parameter <value> is omitted, the command has the same behavior as **AT&F0**.

3.2.2.3. ATZ - Soft Reset

Soft Reset

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

**ATZ[<n>]**

Execution command loads the base section of the specified user profile and the extended section of the default factory profile

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | N/A | user profile number |

Value:

0,1 : user profile number

- i** If parameter <n> is omitted, the command has the same behavior as **ATZ0**
- i** Any active call is terminated.

3.2.2.4. AT&Y - Default Reset Basic Profile Designation

Basic profile on startup.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT&Y=[<n>]

Set command defines the basic profile that will be loaded on startup. The wireless module can store 2 complete configurations (see **&W**).

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---|
| <n> | integer | 0 | basic profile that will be loaded on startup. |

Value:

0,1 : profile index

- i** Differently from command **Z<n>**, which loads just once the desired profile, the one chosen through command **&Y** will be loaded on every startup.
- i** If parameter is omitted the command has the same behavior as **AT&Y0**.

3.2.2.5. AT&P - Default Reset Full Profile Designation

Define which full profile is loaded at startup.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT&P[<n>]

Execution command defines which full profile will be loaded at startup.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------------------|
| <n> | integer | 0 | Configuration parameter |

Value:

0,1 : profile number: the wireless module can store 2 full configurations (see command &W).

- i** Differently from command **Z<n>**, which loads just once the desired profile, the one chosen through command **&P** will be loaded at every startup.
- i** If parameter is omitted, the command has the same behavior as **AT&P0**

3.2.2.6. AT&W - Store Current Configuration

Execution command stores on profile <n> the complete configuration of the device.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&W[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--------------------|
| <n> | integer | 0 | profile identifier |

Value:

0,1 : profile identifiers

- i** If parameter is omitted, the command has the same behavior of AT&W0.

3.2.2.7. AT&N - Display Internal Phonebook Stored Numbers

The command displays telephone numbers stored in the internal phonebook.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&N[<n>]

The module has a built in nonvolatile memory where 10 telephone numbers can be stored, each one having a maximum of 24 digits. Execution command returns the telephone number stored at the <n> position in the internal memory.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------------------|
| <n> | integer | N/A | phonebook record number |

Value:

0÷9 : phonebook record number

-  If parameter <n> is omitted then all the internal records are shown.

3.2.2.8. AT#Z - Extended Reset

Set command loads both base section and extended section of the specified user profile stored with **AT&W** and selected with **AT&P**.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#Z=<profile>

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|--------------------------------------|
| <profile> | integer | 0 | Parameter to select the user profile |

Values:

0 : user profile 0

1 : user profile 1

AT#Z=?

Test command returns **OK** result code.

3.2.2.9. AT&V - Display some Configuration and Profile

The command displays some of the basic modem configuration settings and parameters

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&V

Execution command returns some of the basic modem configuration settings and parameters, one for each row, in the format:

setting/parameter : value

-  The row of information about **CTS (C106) OPTIONS** is in the output of **&V** for compatibility reasons and represents only a dummy value.

Example of returned values.

- **AT&V**

```
COMMAND ECHO           : E1=YES
RESULT MESSAGES        : Q0=YES
VERBOSE MESSAGES       : V1=YES
EXTENDED MESSAGES      : X1=YES
LINE SPEED              : F0=autodetect
CONSTANT DTE SPEED     : YES
FLOW CONTROL OPTIONS   : &K3=HW bidirect.
ERROR CORRECTION
MODE                   : RLP
CTS (C106) OPTIONS     : &B2=OFF while disc.
DSR (C107) OPTIONS     : &S3=PHONE ready->ON
DTR (C108) OPTIONS     : &D0=ignored
DCD (C109) OPTIONS     : &C1=follows carrier
RI (C125) OPTIONS      : \R1=OFF dur. off-hk
C108/1 OPERATION       : &D0=NO
POWER SAVING ON DTR    : +CFUN:1=NO
DEFAULT PROFILE        : &Y0=user profile 1
```

OK

3.2.2.10. AT+GCI - Country of Installation

Set command allows to select the installation country code according to ITU-T35 Annex A.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GCI=<code>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------------|
| <code> | integer | 59 | installation country code |

Value:

59 : it currently supports only the Italy country code

AT+GCI?

Read command reports the currently selected country code.

AT+GCI=?

Test command reports the supported values of parameter <code>.

3.2.2.11. AT+GCAP - Capabilities List

This command returns the equipment supported command set list.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GCAP

Execution command returns the equipment supported command set list:

+GCAP: +CGSM

Additional info:

▶▶ Supported Command Set:

+CGSM: GSM ETSI command set

AT+GCAP=?

Test command returns **OK** result code.

3.2.2.12. AT+GMI - Manufacturer Identification

This command returns the manufacturer identification.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GMI

Execution command returns the manufacturer identification followed by an **<OK>** at newline.

AT+GMI=?

Test command returns **OK** result code.

3.2.2.13. AT+GMM - Model Identification

The command returns the model identification.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GMM

The execution command returns the model identification followed by an <OK> at newline.

AT+GMM=?

Test command returns **OK** result code.

3.2.2.14. AT+GMR - Revision Identification

The command returns the software revision identification.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GMR

Execution command returns the software revision identification followed by an **<OK>** at newline.

AT+GMR=?

Test command returns **OK** result code.

3.2.2.15. AT+GSN - Serial Number

The command reports the device board serial number.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+GSN

Execution command returns the device board serial number.

The number returned is not the IMSI, but it is the board number.

AT+GSN=?

Test command returns **OK** result code.

3.2.2.16. AT+CGMI - Request Manufacturer Identification

The command returns device manufacturer identification code.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CGMI

Execution command returns the device manufacturer identification code followed by an **OK** at newline.

AT+CGMI=?

Test command returns **OK** result code.

3.2.2.17. AT+CGMM - Request Model Identification

This command returns the device model identification.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CGMM

Execution command returns the device model identification code followed by an **OK** at newline.

AT+CGMM=?

Test command returns **OK** result code.

3.2.2.18. AT+CGMR - Request Revision Identification

The command returns device software revision number.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CGMR

Execution command returns device software revision number followed by an **OK** at newline.

AT+CGMR=?

Test command returns **OK** result code.

3.2.2.19. AT+CGSN - Request Product Serial Number Identification

This command allows to retrieve the product serial number in form of IMEI of the mobile.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CGSN

Execution command returns the product serial number in form of IMEI of the mobile followed by an **OK** at newline.

Additional info:

- ▶▶ The IMEI is composed of the following elements (each element shall consist of decimal digits only):
 1. Type Allocation Code (TAC). Its length is 8 digits
 2. Serial Number (SNR) is an individual serial number uniquely identifying each equipment within each TAC. Its length is 6 digits
 3. Luhn Check Digit. Its length is 1 digit

AT+CGSN=?

Test command returns **OK** result code.

3.2.2.20. AT#CGMI - Request Manufacturer Identification

The command returns device manufacturer identification code.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CGMI

Execution command returns the device manufacturer identification code, with command echo.

The response is as follows

#CGMI: *<code>*

OK

AT#CGMI=?

Test command returns **OK** result code.

3.2.2.21. AT#CGMR - Request Revision Identification

The command returns device software revision number.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CGMR

Execution command returns device software revision number, with command echo.

The response is as follows

#CGMR: <num>

OK

AT#CGMR=?

Test command returns **OK** result code.

3.2.2.22. AT#CGSN - Product Serial Number Identification

The execution command returns the product serial number, in form of IMEI of the mobile, with **#CGSN:** command echo.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CGSN

The command returns the following message:

```
AT#CGSN
#CGSN: <product serial number>
OK
```

Additional info:

- ▶▶ The IMEI is composed of the following elements (each element shall consist of decimal digits only):
 1. Type Allocation Code (TAC). Its length is 8 digits
 2. Serial Number (SNR) is an individual serial number uniquely identifying each equipment within each TAC. Its length is 6 digits
 3. Luhn Check Digit. Its length is 1 digit

AT#CGSN=?

The test command returns the **OK** result code.

3.2.2.23. AT#CGMF - Request Product Code

Execution command returns the device product code without **#CGMF:** command echo.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CGMF

The command returns the following message:

```
AT#CGMF  
<productCode>
```

```
OK
```

AT#CGMF=?

Test command returns **OK** result code.

3.2.2.24. AT#SWPKGV - Request Software Package Version

This command shows the software, modem, production, application packages versions. It provides two syntax formats: set and execution.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SWPKGV=<version>

Here is the set format.

Parameter:

| Name | Type | Default | Description |
|-----------|--------|---------|---|
| <version> | string | N/A | selects the type of version to be shown; it must be entered between double quotes |

Values:

- M : shows modem version
- A : shows App version
- P : shows Production version
- PK : shows the full package version

Additional info:

- ▶▶ The execution format returns the packages versions without **#SWPKGV:** command echo. The response is as follows:

```
AT#SWPKGV
<Telit Software Package Version>-<Production Parameters
Version>
<Modem Package Version>
<Production Parameters Version>
<Application Software Version>
```

OK

 **AT#SWPKGV=?**

Test command returns **OK** result code.

3.2.2.25. AT+CPAS - Phone Activity Status

Execution command reports the device status in the form shown in Additional info section.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CPAS

Additional info:

- ▶▶ Message format returned by the execution command:

+CPAS: <pas>

| Name | Type | Default | Description |
|-------|---------|---------|------------------------|
| <pas> | integer | 0 | phone activity status. |

Values:

- 0 : ready (device allows commands from TA/TE)
- 3 : ringing (device is ready for commands from TA/TE, but the ringer is active)
- 4 : call in progress (device is ready for commands from TA/TE, but a call is in progress)

AT+CPAS=?

Test command reports the supported range of values for <pas>.

-
- ⓘ Although **+CPAS** is an execution command, 3GPP TS 27.007 requires the Test command to be defined.
-

3.2.2.26. AT+CFUN - Set Phone Functionality

This command selects the level of functionality in the ME.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CFUN=[<fun>[,<rst>]]

Set command selects the level of functionality in the ME.

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|-----------------------------|
| <fun> | integer | 1 | Power saving function mode. |

Values:

- 0 : NON-CYCLIC SLEEP mode, see Additional info section
- 1 : mobile full functionality with power saving disabled
- 2 : disable TX, not supported
- 4 : disable both TX and RX
- 5 : push the module in power saving, see Additional info section
- 6 : module reboot
- 7 : OFF line mode. This mode cannot be set, can only be read using the read command.
- 8 : FTM. This mode cannot be set, can only be read using the read command.

| | | | |
|--------------------|---------|---|------------|
| <rst> | integer | 0 | reset flag |
|--------------------|---------|---|------------|

Values:

- 0 : do not reset the ME before setting it to <fun> functionality level.
 - 1 : reset the ME before setting it to <fun> functionality level, this option works only with <fun> =1, with other it will return an error
-

Additional info:

▶▶ **<fun>=0**

NON-CYCLIC SLEEP mode, minimum functionality: the AT interface is not accessible by UART. Consequently, once you have set **<fun>=0**, do not send further characters. Otherwise these characters remain in the input buffer and may delay the output of an unsolicited result code. The first wake-up event stops power saving and takes the ME back to full functionality level **<fun>=1**.

▶▶ **<fun>=5**

To place the module in power saving mode set **<fun>= 5** and the DTR line to OFF. Once in power saving, the CTS line switch to the OFF status to signal that the module is really in power saving condition.

During the power saving condition, before sending any AT command on the serial line, the DTR line must be set to ON to exit from power saving and it must be waited for the CTS line to go in ON status.

Until the DTR line is ON, the module will not return in the power saving condition.

- i** Issuing **AT+CFUN=4[,0]** causes the module to perform either a network deregistration and a SIM deactivation.
-

-  If power saving is enabled, it reduces the power consumption during the idle time, thus allowing a longer standby time with a given battery capacity.
-  The power saving function does not affect the network behavior of the module, even during the power save condition the module remains registered on the network and reachable for incoming calls or SMS. If a call comes during the power save, then the module will wake up and proceed normally with the unsolicited incoming call code.

AT+CFUN?

Read command reports the current setting of **<fun>** in the format

+CFUN: <fun>

AT+CFUN=?

Test command returns the list of supported values for **<fun>** and **<rst>**.

3.2.2.27. AT+CMER - Mobile Equipment Event Reporting

This command configures sending of unsolicited result codes from TA to TE.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CMER=[<mode>[,<keyp>[,<disp>[,<ind>[,<bfr>]]]]]

Set command enables/disables sending of unsolicited result codes from TA to TE in the case of indicator state changes.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | controls the processing of unsolicited result codes |

Values:

- 0 : buffer +CIEV Unsolicited Result Codes
- 1 : discard +CIEV Unsolicited Result Codes when TA-TE link is reserved (e.g. on-line data mode); otherwise forward them directly to the TE
- 2 : buffer +CIEV Unsolicited Result Codes in the TA when TA-TE link is reserved (e.g. on-line data mode) and flush them to the TE after reservation; otherwise forward them directly to the TE
- 3 : forward +CIEV Unsolicited Result Codes directly to the TE; when TA is in on-line data mode each +CIEV URC is stored in a buffer; once the ME goes into command

mode (after +++ was entered), all URCs stored in the buffer will be output

| | | | |
|---|---------|---|---------------------------|
| <keyp> | integer | 0 | keypad event reporting |
| Value: | | | |
| 0 : No keypad event reporting | | | |
| <disp> | integer | 0 | display event reporting |
| Value: | | | |
| 0 : no display event reporting | | | |
| <ind> | integer | 0 | indicator event reporting |
| Values: | | | |
| 0 : no indicator event reporting | | | |
| 2 : indicator event reporting | | | |
| <bfr> | integer | 0 | TA buffer clearing |
| Values: | | | |
| 0 : TA buffer of unsolicited result codes is cleared when <mode> 1..3 is entered | | | |
| 1 : TA buffer of unsolicited result codes is flushed to the TE when <mode> 1..3 is entered (OK response shall be given before flushing the codes) | | | |

- i** Sending of URCs in the case of key pressings or display changes are currently not implemented.
- i** After **+CMER** has been switched on with e.g. **AT+CMER=2,0,0,2** command (i.e. **<bfr>** is 0), URCs for all registered indicators will be issued only first time, if previous **<mode>** was 0, for backward compatibility. Values shown by the indicators will be current

indicators values, not buffered ones. Subsequent **+CMER** commands with **<mode>** different from 0 and **<bfr>** equal to 0 will not flush the codes, even if **<mode>** was set again to 0 before. To flush the codes, **<bfr>** must be set to 1.

- i** Although it is possible to issue the command when SIM PIN is pending, it will answer **ERROR** if "message" or "smsfull" indicators are enabled in **+CIND**, because with pending PIN it is not possible to give a correct indication about SMS status. To issue the command when SIM PIN is pending you have to disable "message" and "smsfull" indicators in **+CIND** first.

AT+CMER?

Read command returns the current setting of parameters, in the format:

+CMER: <mode>,<keyp>,<disp>,<ind>,<bfr>

AT+CMER=?

Test command returns the range of supported values for parameters **<mode>**, **<keyp>**, **<disp>**, **<ind>**, **<bfr>**, in the format:

+CMER: (list of supported <mode>s),(list of supported <keyp>s), (list of supported <disp>s),(list of supported <ind>s),(list of supported <bfr>s)

3.2.2.28. AT+CSVM - Set Voice Mail Number

Command to set voice mail server number.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

 **AT+CSVM=<mode>[,<number>[,<type>]]**

Set command is dummy. It only checks for parameters values validity; it does not send any actual write request to SIM to update voice mail number, nor sends any request to network to enable/disable voice mail.

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|-------------------------------|---|
| <mode> | integer | 1 | enable/disable voice mail number |
| Values: | | | |
| 0 | : | disable the voice mail number | |
| 1 | : | enable the voice mail number | |
| <number> | string | - | string type phone number of format specified by <type> |
| <type> | integer | 129 | type of address octet in integer format |

Values:

129 : unknown type of number and ISDN/Telephony numbering plan

145 : international type of number and ISDN/Telephony numbering plan (contains the character "+")

 **AT+CSVM?**

Read command returns the currently selected voice mail number and the status (i.e. enabled/disabled) in the format

+CSVM:<mode>,<number>,<type>

 **AT+CSVM=?**

Test command reports the range for the parameters **<mode>** and **<type>**.

3.2.2.29. AT#MBN - Mailbox Numbers

This command returns the mailbox numbers stored on SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#MBN

Execution command returns the mailbox numbers stored on SIM, if this service is provided by the SIM.

The response is in the format:

```
[#MBN: <index>,<number>,<type>[,<text>][,<mboxtype>][<CR><LF>
#MBN: <index>,<number>,<type>[,<text>][,<mboxtype>[...]]]
```

Additional info:

- ▶▶ The response has its fields described below.

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <index> | integer | - | record number |
| <number> | string | - | string type mailbox number in the format <type> |
| <type> | integer | N/A | type of mailbox number octet in integer format |
| Values: | | | |
| | 129 | : | national numbering scheme |
| | 145 | : | international numbering scheme (contains the character "+") |
| <text> | string | - | the alphanumeric text associated to the number; used character set should be the one selected with command +CSCS |

| | | | |
|-------------------------|--------|-----|---|
| <mboxtype> | string | N/A | the message waiting group type of the mailbox, if available |
|-------------------------|--------|-----|---|

Values:

VOICE : voice

FAX : fax

EMAIL : electronic mail

OTHER : other

-  If all queried locations are empty (but available), no information text lines will be returned.

AT#MBN=?

Test command returns the **OK** result code.

3.2.2.30. AT#MWI - Message Waiting Indication

This command enables/disables the presentation of the Message Waiting Indicator (MWI) URC.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#MWI=[<enable>]

Set command enables/disables the presentation of the Message Waiting Indicator URC, it can have two formats, as show in Additional info.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <enable> | integer | 1 | enables/disables the presentation of the #MWI: URC |

Values:

- 0 : disables the presentation of the #MWI: URC
- 1 : enables the presentation of the #MWI: URC, see Additional info.

Additional info:

- ▶▶ If **AT#MWI=1** has been entered, the **#MWI: URC** is displayed each time

1. a new message waiting indicator is received from the network, the URC format is:

#MWI: <status>,<indicator>[,<count>]

2. the module is powered on, the URC reports the status of the message waiting indicators, as they are currently stored on SIM, the format is:

```
#MWI: <status>[,<indicator>[,<count>]][<CR><LF>
#MWI: <status>,<indicator>[,<count>][...]]]
```

The parameters are described in the unsolicited fields section for each URC format.

Unsolicited fields:

| Name | Type | Description |
|--------------------------|---------|--|
| <status> | integer | <p>indicates clear or set action when it is received from the network.</p> <p>Values:</p> <p>0 : clear: has been deleted one of the messages related to the indicator <indicator>.</p> <p>1 : set: there is a new waiting message related to the indicator <indicator></p> |
| <status> | integer | <p>indicates the status when it is read from SIM.</p> <p>Values:</p> <p>0 : no waiting message indicator is currently set. In this case no other information is reported.</p> <p>1 : there are waiting messages related to the message waiting indicator <indicator></p> |
| <indicator> | integer | <p>message indicator has the same meaning regardless if it comes from network or it is read from SIM.</p> <p>Values:</p> <p>1 : either Line 1 (CPHS context) or Voice (3GPP context)</p> |

2 : Line 2 (CPHS context only)

3 : Fax

4 : E-mail

5 : Other

| | | |
|----------------------|---------|--|
| <count> | integer | network information reporting the number of pending messages related to the message waiting indicator <indicator> . |
|----------------------|---------|--|

| | | |
|----------------------|---------|---|
| <count> | integer | number of pending messages related to the message waiting indicator <indicator> as it is stored on SIM |
|----------------------|---------|---|

 Entering **AT#MWI=** returns **OK** but has no effect.

AT#MWI?

Read command reports whether the presentation of the message waiting indicator URC is currently enabled or not, and the status of the message waiting indicators as they are currently stored on SIM. The format is:

```
#MWI: <enable>,<status>[,<indicator>[,<count>]][<CR><LF>
#MWI: <enable>,<status>,<indicator>[,<count>][...]]
```

AT#MWI=?

Test command returns the range of available values for parameter **<enable>**.

3.2.2.31. AT+CLAC - Available AT Commands

This command shows the available AT commands list.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CLAC

The execution command causes the ME to return one or more lines reporting the AT commands that are available to the user. The format is:

```
<ATcmd1>[<CR><LF><ATcmd2>[...]]
```

<ATcmdn> is the AT command.

AT+CLAC=?

Test command returns the OK result code.

3.2.2.32. AT#LANG - Select Language

Set command selects the currently used language for displaying different messages.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#LANG=<lan>

Parameter:

| Name | Type | Default | Description |
|-------|--------|---------|-------------------|
| <lan> | string | en | Selected language |

Values:

en : English

it : Italian

AT#LANG?

Read command reports the currently selected <lan> in the format:

#LANG: <lan>

AT#LANG=?

Test command reports the supported range of values for parameter <lan>.

3.2.2.33. AT+CMEE - Report Mobile Equipment Error

The command enables the use of result code.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CMEE=[<n>]

Set command disables/enables the use of result code **+CME ERROR: <err>** as an indication of an error relating to the **+Cxxx** command issued. When enabled, device related errors cause the **+CME ERROR: <err>** final result code instead of the default **ERROR** final result code. **ERROR** is returned normally when the error message is related to syntax, invalid parameters or DTE functionality.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | 0 | enables/disables +CME ERROR: <err> result code and selects the format |

Values:

- 0 : disable
- 1 : enable and use numeric<err> values
- 2 : enable and use verbose <err> values

i The detailed description of <err> is available in section "ME Error Result Code - +CME ERROR: <err>".

i **+CMEE** has no effect on the final result code **+CMS**.

AT+CMEE?

Read command returns the current value of parameter <n> in the format:

+CMEE: <n>

AT+CMEE=?

Test command returns the supported values of parameter <n>.

3.2.2.34. AT#CEER - Extended Numeric Error Report

The command is related to extended numeric error report.

3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#CEER

Execution command causes the TA to return a numeric code in the intermediate response format:

#CEER: <code>

which offers the user of the TA a report of the reason for

3. the last unsuccessful GPRS attach or unsuccessful PDP context activation;
4. the last GPRS detach or PDP context deactivation.

Additional info:

- ▶▶ Intermediate response parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <code> | integer | - | error code. Table below show the error codes range and the related meanings. |

- ▶▶ [Error codes table](#)

| Value | Diagnostic |
|-------|---|
| 0 | No error |
| 31 | Normal, unspecified |
| | GPRS related errors |
| 224 | MS requested detach |
| 225 | NWK requested detach |
| 226 | Unsuccessful attach cause NO SERVICE |
| 227 | Unsuccessful attach cause NO ACCESS |
| 228 | Unsuccessful attach cause GPRS SERVICE REFUSED |
| 229 | PDP deactivation requested by NWK |
| 230 | PDP deactivation cause LLC link activation Failed |
| 231 | PDP deactivation cause NWK reactivation with same TI |
| 232 | PDP deactivation cause GMM abort |
| 233 | PDP deactivation cause LLC or SNDSCP failure |
| 234 | PDP unsuccessful activation cause GMM error |
| 235 | PDP unsuccessful activation cause NWK reject |
| 236 | PDP unsuccessful activation cause NO NSAPI available |
| 237 | PDP unsuccessful activation cause SM refuse |
| 238 | PDP unsuccessful activation cause MMI ignore |
| 239 | PDP unsuccessful activation cause Nb Max Session Reach |
| 256 | PDP unsuccessful activation cause wrong APN |
| 257 | PDP unsuccessful activation cause unknown PDP address or type |
| 258 | PDP unsuccessful activation cause service not supported |
| 259 | PDP unsuccessful activation cause QOS not accepted |
| 260 | PDP unsuccessful activation cause socket error |

-
-  If none of the previous conditions has occurred since power up, then `<code>=0` is reported (i.e. No error, see table above)
-

 **AT#CEER=?**

Test command returns **OK** result code.

3.2.2.35. AT#PSMRI - Power Saving Mode Ring Indicator

The command enables or disables the Ring Indicator pin response to an URC message while modem is in power saving mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Required | Common profile | No | - | 2 |

AT#PSMRI=<n>

Set command enables/disables the Ring Indicator pin response to an URC message while modem is in power saving mode. If enabled, a negative going pulse is generated, when URC message for specific event is invoked. The duration of this pulse is determined by the value of <n>.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---|
| <n> | integer | 0 | disables, enables/sets duration of the generated pulse. |

Values:

- 0 : disables RI pin response for URC message
- 50÷1150 : enables RI pin response for URC messages with a duration specified in ms

- i** When RING signal from incoming call/SMS/socket listen is enabled, the behavior for #PSMRI will be ignored.
- i** The behavior for #PSMRI is invoked only when modem is in sleep mode AT+CFUN=5.

AT#PSMRI?

Read command reports the duration in ms of the pulse generated, in the format:

#PSMRI: <n>

AT#PSMRI=?

Test command reports the supported range of values for parameter <n>

The value set by command is stored in the profile extended section and doesn't depend on the specific AT instance used to enter the command.

3.2.2.36. AT+CSCS - Select TE Character Set

The command purpose is to set different character sets that are used by the device.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CSCS=[<chset>]

Set command sets the current character set used by the device.

Parameter:

| Name | Type | Default | Description |
|---------|--------|---------|---|
| <chset> | string | IRA | character set to be used by the device. |

Values:

- GSM : GSM default alphabet (3GPP TS 23.038).
- IRA : international reference alphabet (ITU-T T.50).
- 8859-1 : ISO 8859 Latin 1 character set.
- PCCP437 : PC character set Code Page 437.
- UCS2 : 16-bit universal multiple-octet coded character set (ISO/IEC10646).
- HEX : Character strings consist only of hexadecimal numbers from 00 to FF; e.g. "032FE6" equals three 8-bit characters with decimal values 3, 47 and 230; no conversions to the original MT character set shall be done. If MT is using GSM 7 bit default alphabet, its characters

shall be padded with 8th bit (zero) before converting them to hexadecimal numbers (i.e. no SMS style packing of 7 bit alphabet).

AT+CSCS?

Read command returns the current value of the active character set.

AT+CSCS=?

Test command returns the supported values for parameter **<chset>**.

3.2.2.37. AT+CMUX - Multiplexing Mode

This command is used to enable/disable the multiplexing protocol control channel.

3GPP TS 27.007
3GPP TS 27.010

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CMUX=<mode>[,<subset>[,<port_speed>[,<N1>[,<T1>[,<N2>[,<T2>[,<T3>[,<k>]]]]]]]]

Set command is used to enable/disable the multiplexing protocol control channel.

Parameters:

| Name | Type | Default | Description |
|---------------------------|---------|---------|--|
| <mode> | integer | 0 | basic option is currently the only supported mode. |
| | Value: | | |
| | 0 | : | basic option mode. |
| <subset> | integer | 0 | the way in which the multiplexer control channel is set up |
| | Value: | | |
| | 0 | : | UIH frame |
| <port_speed> | integer | N/A | transmission rate. The default value is implementation specific. |
| | Values: | | |
| | 1 | : | 9600 bps |
| | 2 | : | 19200 bps |

3 : 38400 bps

4 : 57600 bps

5 : 115200 bps

6 : 230400 bps

<N1> integer 122 maximum frame size.

Value:

1÷1500 : expressed in bytes

<T1> integer 10 acknowledgement timer in units of ten milliseconds

Value:

1÷255 : in units of ten milliseconds

<N2> integer 3 maximum number of re-transmissions

Value:

0÷100 : range of re-transmissions number

<T2> integer 30 response timer for the multiplexer control channel. T2 must be longer than T1.

Value:

2÷255 : in units of ten milliseconds

<T3> integer 10 wake up response timer

Value:

1÷255 : in seconds

<k> integer 2 window size, for Advanced option with Error-Recovery Mode

Value:

1÷7 : window size range

 **AT+CMUX?**

Read command returns the current value of the parameters, in the format:
+CMUX: <mode>,<subset>,<port_speed>,<N1>,<T1>,<N2>,<T2>,<T3>,<k>

 **AT+CMUX=?**

Test command returns the range of supported values for all parameters.

3.2.2.38. AT#USBCFG - USB Configuration

This command sets USB configuration on the modem device.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#USBCFG=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | USB configuration mode. See #PORTCFG command. |

Values:

- 0 : USB Modem Ports, 1 Diag Port, 1 WWAN network adapter (no data traffic); VID 0x1BC7 PID 0x110A
- 3 : USB Modem Ports, 1 Diag Port, 1 ECM network adapter; VID 0x1BC7 PID 0x110B

 To make active the configuration the module must be rebooted.

AT#USBCFG?

Read command returns the current <mode> in the following format:

#USBCFG: <mode>

AT#USBCFG=?

Test command returns the list of supported values.

| Modules supporting the command | |
|--------------------------------|-----|
| ME310G1 | -WW |
| ME910G1 | -WW |
| ML865G1 | -WW |

3.2.2.39. AT#PORTCFG - Connect Physical Ports to Service Access Points

This command allows to connect Service Access Points (software anchorage points) to the external physical ports.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#PORTCFG=<Variant>

Set command allows to connect Service Access Points to the external physical ports giving a great flexibility. Examples of Service Access Points: AT Parser Instance #1, #2, #3, etc..

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <Variant> | integer | 0 | set port configuration. A short description, for each <Variant> value, is reported in test command section. The range depends on the product. |

Value:

0÷max : see test command section

To enable the set port configuration, the module must be rebooted.

AT#PORTCFG?

Read command returns the requested and the active port configuration in the format:

#PORTCFG: <requested>,<active>

Additional info:

- ▶ Parameters returned by the read command, in format:

#PORTCFG: <requested>,<active>

| Name | Type | Default | Description |
|-------------|---------|---------|--|
| <requested> | integer | - | value showing the requested configuration that will be activated on the next power ON. |
| <active> | integer | - | value showing the actual configuration. |

AT#PORTCFG=?

Test command returns a brief description of the supported ports arrangement solutions.

For each <Variant> are reported, on one row, the logical connections between a physical port (USIF0, USB0, etc.) and a Service Access Point (AT#1, AT#2, etc.). Each row reports the logical connections available in two configurations: USB cable plugged or not plugged in. To have information about the physical ports, refer to document [1].

The test command returns, for example, the following message:

For ME310G1 family modules:

AT#PORTCFG=?

#PORTCFG: Variant=0: AT= USIF0 USB0 USB1

#PORTCFG: Variant=3: AT= USIF0 AUX USB0

#PORTCFG: Variant=8: AT= USB0 USB1

#PORTCFG: Variant=13: AT= USIF0 USB0

OK

For ME910G1 family modules and ML865G1 module:

AT#PORTCFG=?

#PORTCFG: Variant=0: AT= USIF0 USB0 USB1

#PORTCFG: Variant=3: AT= USIF0 USIF1 USB0

#PORTCFG: Variant=8: AT= USB0 USB1

#PORTCFG: Variant=13: AT= USIF0 USB0

OK

The <Variant> range depends on the product.

3.2.2.40. AT#ATDELAY - AT Command Delay

Set command sets a delay in second for the execution of successive AT command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ATDELAY=<delay>

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|----------------|
| <delay> | integer | 0 | delay interval |

Value:

0÷max : delay expressed in 100 milliseconds intervals; 0 means no delay. For max value refer to test command

 <delay> is only applied to first command executed after #ATDELAY

AT#ATDELAY=?

Test command returns the supported range of values for parameter <delay>.

 Set 5 seconds delay for "AT#GPIO=1,1,1" command

```
AT#GPIO=1,0,1;#ATDELAY=50;#GPIO=1,1,1
OK
```

3.2.2.41. AT&Z - Store Telephone Number in the Internal Phonebook

The command stores a telephone number in the internal phonebook.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&Z<n>=<nr>

The module has a built in non-volatile memory where 10 telephone numbers can be stored, each one having a maximum of 24 digits. Execution command stores the telephone number <nr> in the record <n>. The records cannot be overwritten; they must be cleared before rewriting.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <n> | integer | N/A | phonebook record |
| Value: | | | |
| | 0÷9 | : | record number |
| <nr> | string | - | telephone number (maximum length 24 digits) |

-  To delete the record <n> issue the command **AT&Z<n>=<CR>**.
-  The records in the module memory can be viewed with the command **&N**.

3.2.2.42. AT&V2 - Display Last Connection Statistics

The command displays last connection statistics.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&V2

Execution command returns the last connection statistics and connection failure reason.

 Example of connection statistics get with no connection and no error.

- AT&V2

```
TOTAL CONNECTION TIME      : 0:00:00
CONNECTION FAILURE REASON  : powered off
```

```
OK
```

3.2.2.43. AT+IMEISV - Request IMEI and Software Version

Execution command returns the International Mobile Station Equipment Identity and Software Version Number (IMEISV) of the module without **+IMEISV:** command echo.

3GPP TS 23.003

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+IMEISV

The command returns the following message:

```
AT+IMEISV
<IMEISV>
```

OK

Additional info:

- ▶▶ The IMEISV is composed of the following elements (each element shall consist of decimal digits only):
 5. Type Allocation Code (TAC). Its length is 8 digits
 6. Serial Number (SNR) is an individual serial number uniquely identifying each equipment within each TAC. Its length is 6 digits
 7. Software Version Number (SVN) identifies the software version number of the mobile equipment. Its length is 2 digits

 **AT+IMEISV=?**

Test command returns **OK** result code.

3.2.2.44. AT#CGMM - Request Model Identification

This command returns the device model identification.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CGMM

Execution command returns the device model identification code, with command echo.

```
AT#CGMM
#CGMM: <code>
OK
```

AT#CGMM=?

Test command returns **OK** result code.

3.2.2.45. AT&V0 - Display Current Configuration and Profile

The command displays current modem configuration and profile.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&V0

Execution command returns all the modem configuration parameters settings.

-  This command is the same as **&V**, it is included only for backwards compatibility.
-  The row of information about CTS (C106) OPTIONS is in the output of **&V0** only for compatibility reasons and represents only a dummy value.

3.2.2.46. AT#FWSWITCH - Set Active Firmware Image

Set command allows enabling a specific firmware image on products embedding 2 or more different firmware images.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#FWSWITCH=<imageNumber>[,<storageConf>[,<restoreUserSettings>]]**

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|---------------|---------|---|---|
| <imageNumber> | integer | - | To know the <imageNumber> values range refer to the test command. |
|---------------|---------|---|---|

| | | | |
|---------------|---------|---|----------------------|
| <storageConf> | integer | 1 | selects storage type |
|---------------|---------|---|----------------------|

Value:

1 : save the <imageNumber> value in NVM, only this selection is available

| | | | |
|-----------------------|---------|---|--|
| <restoreUserSettings> | integer | 0 | restore user settings for enabled firmware image |
|-----------------------|---------|---|--|

Values:

0 : after firmware switch, all settings are returned to default

1 : after firmware switch, user settings are restored

Additional info:

- **<imageNumber>** identifies the image (customization) as shown in the following table.

| Product | Customization | <image Number> default value |
|------------|--|------------------------------|
| MEx10G1-W1 | 0 = AT&T, 1 = Verizon, 2 = ROW | 2 |
| MEx10G1-WW | 0 = AT&T, 1 = Verizon, 2 = ROW, 3 = AU | 2 |

-  This AT command performs a system reboot. All the parameters are set to the factory values.

Here are two customization examples: **AT#FWSWITCH=0** and **AT#FWSWITCH=1**. In both cases it is mandatory to follow these steps.

AT&T customization:

1. enter: **AT#FWSWITCH=0**
2. wait: system reboot
3. enter: **AT#IOTBND=252582047,1048578,2058,0**
4. enter: **AT#REBOOT**
5. wait: system reboot

now, the module is ready to operate

Verizon customization:

1. enter: **AT#FWSWITCH=1**
2. wait: system reboot
3. enter: **AT#REBOOT**
4. wait: system reboot

now, the module is ready to operate

AT#FWSWITCH?

Read command reports the current active firmware image:

#FWSWITCH: <imageNumber>

 **AT#FWSWITCH=?**

Test command reports the range of supported values for parameters <imageNumber>, <storageConf>, <restoreUserSettings>

 Switch to image 1:
AT#FWSWITCH =1
OK

3.2.2.47. AT#IMSPDPSET - IMS PDP APN Number Set

This command sets IMS Pdp APN Name. This name should be one of the APN names set in **+CGDCONT** command and appropriated context will be opened for IMS.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#IMSPDPSET=<pdpApnName>

Parameter:

| Name | Type | Default | Description |
|--------------|--------|---------|---|
| <pdpApnName> | string | - | from 1 to 32 symbols ANSI fixed string. It can be used with or without quotes |

AT#IMSPDPSET?

Read command reports the current setting of string parameter <pdpApnName>, in the format:

#IMSPDPSET: <pdpApnName>

-  If the file containing the setting is not present in EFS, read command returns an error:

**AT#IMSPDPSET?
+CME ERROR: Unable to read the nv file**

The file must be created by the set command.

AT#IMSPDPSET=?

Test command returns the maximum length for string parameter <pdpApnName>.

3.2.2.48. AT#TXCAL4G - Change Max TX Power Level for a Supported Band

Set command change the maximum power level for the band specified.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#TXCAL4G=<band>[,<txPwrLev>]

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <band> | integer | - | number of the LTE band whose TX maximum power level must be changed. To know its range, use Test command. |
| <txPwrLev> | integer | - | maximum tx power level for the band specified expressed in 1/16dBm. Example: 368 = 23dBm. To know its range, use Test command. If <txPwrLev> is not specified, the default value for maximum TX power level is set for the band <band> |

AT#TXCAL4G?

Read command returns the bands supported and the maximum power level set for each band in the format:

```
#TXCAL4G: <band>,<txPwrLev>
#TXCAL4G: <band>,<txPwrLev>
#TXCAL4G: <band>,<txPwrLev>
#TXCAL4G: <band>,<txPwrLev>
#TXCAL4G: <band>,<txPwrLev>
...
```

 **AT#TXCAL4G=?**

Test command reports the supported range of parameters values.

3.2.2.49. AT#TID - Request Telit ID

The command returns Telit ID and version number.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#TID

Execution command returns device Telit ID and version number separated by a comma, followed by an **OK** at newline.

AT#TID=?

Test command returns **OK** result code.

3.2.3. S Parameters

3.2.3.1. ATSO - Number of Rings to Auto Answer

The command controls the automatic answering feature of the DCE.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATSO=[<n>]

Set command sets the number of rings required before device automatically answers an incoming call.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-----------------|
| <n> | integer | 0 | Number of rings |

Values:

0 : auto answer disabled

1÷255 : number of rings required before automatic answer. The DCE answers when the incoming call indication (ring) has occurred the number of times indicated by the value.

Data only products ignore command setting and auto answer is disabled if incoming call is a voice call.

ATS0?

Read command returns the current value of **S0** parameter.

3.2.3.2. ATS1 - Ring Counter

S1 is incremented each time the device detects the ring signal of an incoming call. **S1** is cleared as soon as no ring occur.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS1

 The form **ATS1** has no effect, returns **OK** result code.

ATS1?

Read command returns **S1** value.

3.2.3.3. ATS2 - Escape Character

The command manages the ASCII character used as escape character.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS2=<char>

Set command sets the ASCII character to be used as escape character.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------------|
| <char> | integer | 43 | escape character decimal ASCII |

Value:

0÷255 : factory default value is '+'

-  The escape sequence consists of three escape characters preceded and followed by **n** ms of idle (see **S12** to set **n**).

ATS2?

Read command returns the current value of **S2** parameter.

-  The format of the numbers in output is always 3 digits, left-filled with 0s.

3.2.3.4. AT3 - Command Line Termination Character

The command manages the character configured as command line terminator.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT3=[<char>]

Set command sets the value of the character either recognized by the device as command line terminator and generated by the device as part of the header, trailer, and terminator for result codes and information text, along with **S4** parameter.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <char> | integer | 13 | command line termination character (decimal ASCII) |

Value:

0÷127 : command line termination character

- i** The "previous" value of **S3** is used to determine the command line termination character for entering the command line containing the **S3** setting command. However, the result code issued shall use the "new" value of **S3** (as set during the processing of the command line)

AT3?

Read command returns the current value of **S3** parameter.

- i** The format of the numbers in output is always 3 digits, left-filled with 0s
-

3.2.3.5. ATS4 - Response Formatting Character

The command manages the character generated by the device as part of the header, trailer, and terminator for result codes and information text.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS4=[<char>]

Set command sets the value of the character generated by the device as part of the header, trailer, and terminator for result codes and information text, along with the **S3** parameter.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <char> | integer | 10 | response formatting character (decimal ASCII) |

Value:

0÷127 : response formatting character

- i** If the value of **S4** is changed in a command line the result code issued in response of that command line will use the new value of **S4**.

ATS4?

Read command returns the current value of **S4** parameter.

-
- i** The format of the numbers in output is always 3 digits, left-filled with 0s.
-

3.2.3.6. ATS5 - Command Line Editing Character

The command manages the value of the character recognized by the DCE as a request to delete from the command line the immediately preceding character.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS5=[<char>]

Set command sets the value of the character recognized by the device as a request to delete from the command line the immediately preceding character.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <char> | integer | 8 | command line editing character (decimal ASCII) |

Value:

0÷127 : command line editing character

ATS5?

Read command returns the current value of **S5** parameter.

- i** The format of the numbers in output is always 3 digits, left-filled with 0s.

3.2.3.7. ATS7 - Connection Completion Time-Out

This set command specifies the amount of time that the DCE shall allow between either answering a call (automatically or by the **ATA** command) or completion of signaling of call addressing information to network (dialing), and establishment of a connection with the remote DCE. If no connection is established during this time, the DCE disconnects from the line and returns a result code indicating the cause of the disconnection.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS7=<tout>

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|--------|---------|----|--|
| <tout> | integer | 60 | defines time interval expressed in seconds |
|--------|---------|----|--|

Value:

1÷255 : available range

ATS7?

Read command returns the current value of **S7** parameter.

- i** The format of the numbers in output is always 3 digits, left-filled with 0s.

3.2.3.8. ATS12 - Escaper Prompt Delay

The command manages the prompt delay between two different escape characters.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS12=<time>

Set command sets:

5. the minimum period, before receipt of the first character of the three escape character sequence, during which no other character has to be detected in order to accept it as valid first character;
6. the maximum period allowed between receipt of first or second character of the three escape character sequence and receipt of the next;
7. the minimum period, after receipt of the last character of the three escape character sequence, during which no other character has to be detected in order to accept the escape sequence as a valid one.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <time> | integer | 50 | delay expressed in fiftieth of a second |

Value:

2÷255 : expressed in fiftieth of a second

-  The minimum period **S12** has to pass after **CONNECT** result code too, before a received character is accepted as valid first character of the three escape character sequence.

ATS12?

Read command returns the current value of **S12** parameter.

-
- i** The format of the numbers in output is always 3 digits, left-filled with 0s
-

3.2.3.9. ATS25 - Delay to DTR Off

The command manages the amount of time that the device will ignore the **DTR**.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS25=<time>

Set command defines the amount of time, in hundredths of second, that the device will ignore the **DTR** for taking the action specified by command **&D**.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|-------------------------------------|
| <time> | integer | 5 | expressed in hundredths of a second |

Value:

0÷255 : expressed in hundredths of a second

-  The delay is effective only if its value is greater than 5. To be recognized as valid, the **DTR** transition must be greater than **S25**. Low values could require a transition increased of a factor 1.5 to be correctly handled (e.g., to be sure that **S25=5** works, use a **DTR** toggle of 75ms to be detected).
-  In power saving (e.g. **+CFUN=5** with **DTR** low) **DTR** must be off at least 3 seconds for taking the action specified by command **&D**, independently of **S25** parameter.

ATS25?

Read command returns the current value of **S25** parameter.

-
- i** The format of the numbers in output is always 3 digits, left-filled with 0s.
-

3.2.3.10. AT&V1 - S Registers Display

The command displays the S registers values.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&V1

Execution command returns the S registers values in both decimal and hexadecimal format. The response is in the form:

| REG (S register) | DEC (value in dec. notation) | HEX (value in hex notation) |
|------------------|------------------------------|-----------------------------|
| <reg0> | <dec> | <hex> |
| <reg1> | <dec> | <hex> |
| ... | ... | ... |
| <regN> | <dec> | <hex> |

Here is a generic example showing the format.

AT&V1

| REG | DEC | HEX |
|-----|-----|-----|
| 000 | 000 | 000 |
| 001 | 000 | 000 |
| 002 | 043 | 02B |
| 003 | 013 | 00D |
| 004 | 010 | 00A |
| 005 | 008 | 008 |
| 007 | 060 | 03C |
| 012 | 050 | 032 |

... ..
... ..

OK

3.2.3.11. ATS10 - Carrier Off with Firm Time

The command is available only for backward compatibility

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATS10=<n>

Execution command has no effect and is available only for backward compatibility with landline modems.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------|
| <n> | integer | N/A | dummy |

Value:

1÷255 : dummy parameter

3.2.3.12. AT&V3 - Extended S Registers Display

The command displays the extended S registers values.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&V3

Execution command returns the extended S registers values in both decimal and hexadecimal format. The response is in the form as shown in **AT&V1** command.

 Here is a generic example showing the format.

AT&V3

```

REG  DEC  HEX
000  000  000
001  000  000
002  043  02B
003  013  00D
004  010  00A
005  008  008
007  060  03C
012  050  032
025  005  005
...   ...   ...
...   ...   ...

```

OK

3.2.4. DTE - Modem Interface Control

3.2.4.1. ATE - Command Echo

This command allows to enable or disable the command echo.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATE[<n>]

The execution command allows to enable/disable the command echo.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | 1 | Configuration value |

Values:

0 : disables command echo

1 : enables command echo, hence command sent to the device are echoed back to the DTE before the response is given.

- i** If parameter is omitted, the command has the same behavior of **ATE0**

3.2.4.2. ATQ - Quiet Result Codes

This command allows to enable or disable the result code.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATQ[<n>]

Set command enables or disables the result codes.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------------------------|
| <n> | integer | 0 | enables/disables result codes |

Values:

- 0 : enables result codes
- 1 : disables result codes. The commands entered after ATQ1 do not return the result code.
- 2 : disables result codes (only for backward compatibility). The commands entered after ATQ2 do not return the result code.

- i** If parameter is omitted, the command has the same behavior of ATQ0.

After issuing **ATQ0** the **OK** result code is returned

AT+CGACT=?

+CGACT: (0-1)

OK

After issuing **ATQ1** or **ATQ2** the **OK** result code is not returned.

AT+CGACT=?

+CGACT: (0-1)

3.2.4.3. ATV - Response Format

Set command determines the contents of the header and trailer transmitted with result codes and information responses. It also determines if result codes are transmitted in a numeric form or an alphanumeric form (according to [1]).

[1] ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

ATV[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | 1 | format of information responses and result codes. See Additional info section. |

Values:

- 0 : limited headers and trailers and numeric format of result codes
- 1 : full headers and trailers and verbose format of result codes

Additional info:

| <n>=0 | |
|-----------------------|----------------------------|
| information responses | <text><CR><LF> |
| result codes | <numericCode><CR> |
| | |
| <n>=1 | |
| information responses | <CR><LF> <text><CR><LF> |

| | |
|--------------|-----------------------------------|
| result codes | <CR><LF> <verboseCode><CR><LF> |
|--------------|-----------------------------------|

- i** the **<text>** portion of information responses is not affected by this setting.
- i** if parameter is omitted, the command has the same behavior of **ATV0**

3.2.4.4. ATI - Identification Information

This command returns identification information.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

ATI[<n>]

Execution command returns one or more lines of information text followed by a result code.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | 0 | information request |

Values:

- 0 : numerical identifier
- 1 : module checksum
- 2 : checksum check result
- 3 : manufacturer
- 4 : product name
- 5 : DOB version

- i** If parameter is omitted, the command has the same behavior of **ATI0**

3.2.4.5. AT&C - Data Carrier Detect (DCD) Control

This set command controls the DCD output behavior of the AT commands serial port.

ITU-T Recommendation V25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT&C[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | 1 | DCD output behavior |

Values:

- 0 : DCD remains always High
- 1 : DCD follows the Carrier detect status: if carrier is detected DCD goes High, otherwise DCD is Low
- 2 : DCD is always High except for 1 sec "wink" when a data call is disconnected

- i** If parameter is omitted, the command has the same behavior of **AT&C0**

3.2.4.6. AT&D - Data Terminal Ready (DTR) Control

This set command configures the behavior of the module according to the DTR control line transitions (RS232).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT&D[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---|
| <n> | integer | 0 | defines the module behavior according to the DTR control line transitions |

Values:

- 0 : module ignores DTR control line transitions
- 1 : when the module is connected, the high to low transition of DTR line sets the module in command mode, the current connection is not closed
- 2 : when the module is connected, the high to low transition of DTR line sets the module in command mode and the current connection is closed
- 3 : C108/1 operation is enabled
- 4 : C108/1 operation is disabled

- i** If **AT&D2** has been issued, and the DTR line has been tied Low, auto-answering is inhibited and it is possible to answer only issuing command **ATA**.
- i** If parameter is omitted, the command has the same behavior of **AT&D0**.

3.2.4.7. AT&K - Flow Control

Flow Control settings.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT&K=[<n>]

Set command controls the serial port flow control behavior.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-----------------------|
| <n> | integer | 0 | flow control behavior |

Values:

- 0 : no flow control
- 3 : hardware bi-directional flow control (both RTS/CTS active)

- i** If parameter is omitted, the command has the same behavior as AT&K0
- i** &K has no Read Command. To verify the current setting of &K, simply check the settings of the active profile issuing AT&V.

3.2.4.8. AT&S - Data Set Ready (DSR) Control

Set DSR pin behavior.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT&S[<n>]

Set command controls the RS232 DSR pin behavior.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------------------|
| <n> | integer | 3 | Configuration parameter |

Values:

- 0 : always High
- 1 : DSR is tied High when the device receives from the network the GSM traffic channel indication
- 2 : High when connected
- 3 : High when device is ready to receive commands

- i** If parameter is omitted, the command has the same behavior of **AT&S0**
- i** In power saving mode the **DSR** pin is always tied Low.

3.2.4.9. AT+IPR - UART DCE Interface Data Rate Speed

The command sets the speed of the USIF0 serial port, see document [1].

[1] Hardware User's Guide of the used module

[2] ITU-T Recommendation V25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+IPR=<rate>

The command sets the UART speed of the USIF0 port during command mode operations.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <rate> | integer | 115200 | speed of the serial USIF0 port expressed in bit per second. |

Values:

300 : bps

600 : bps

1200 : bps

2400 : bps

4800 : bps

9600 : bps

19200 : bps

38400 : bps

57600 : bps

115200 : bps

230400 : bps

460800 : bps

921600 : bps

AT+IPR?

Read command returns the current value of **<rate>** parameter.

AT+IPR=?

Test command returns the list of **<rate>** values in the format:

+IPR: (list of <rate> values)

This command has no effect if it is sent on **USB** interface or **CMUX** instances: the DCE sends the **OK** result but the settings are ignored.

Test command example

```
AT+IPR=?
```

```
+IPR:
```

```
(300,600,1200,2400,4800,9600,19200,38400,57600,115200,230400,460800,921600)
```

```
OK
```

3.2.4.10. AT#DTR - Data Terminal Ready (DTR) flow control

The command configures how the outbound flow on serial ports is controlled by the DTR signal, see document [1]

[1] Hardware User's Guide of the used module

[2] ITU-T Recommendation V25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#DTR=<n>

This set command configures the behavior of the outbound flow according to the DTR control line level transitions.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|------------------------------------|
| <n> | integer | N/A | DTR outbound flow control behavior |

Values:

- 0 : DTR level transitions are ignored and cannot control the outbound data flow. (Supported only by UART ports).
- 1 : DTR level transitions control the outbound data flow. If DTR is asserted, the output data is sent; if DTR is not asserted, the output data is blocked. (Supported only by ports with DTR signal)
- 2 : Like setting 1, but receiving input data has the same effect of a low to high level transition. Therefore, if the DTR is not asserted, or if it is asserted but its level has

not been signaled by the DTE to the DCE, after receiving input data the DTR is considered asserted. A new DTR level transition from asserted to not asserted will block again the outbound flow. (Supported only by USB ports)

Additional info:

- ▶▶ For USIF ports default value of **<n>** is 0.

- ▶▶ For USB ports default value of **<n>** is 2.

- ▶▶ The range depends on the port.

AT#DTR?

Read command returns the current value of **<n>** parameter.

AT#DTR=?

Test command returns the list of **<n>** values in the format:

#DTR: (list of <n> values)

This command returns only the **<n>** values supported by the port on which it is given;
i.e. USB ports do not support **<n>=0**; USIF ports without DTR pin only support **<n>=0**.

Test command example

```
AT#DTR=?
```

```
#DTR: (0,1)
```

```
OK
```

3.2.4.11. AT+IFC - DTE-Modem Local Flow Control

This set command selects the flow control of the serial port in both directions.

ITU-T Recommendation V25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+IFC=<byDTE>,<byDCE>

Parameters:

| Name | Type | Default | Description |
|---------|---------|--|---|
| <byDTE> | integer | 0 | specifies the method used by the DTE to control the flow of data received from the device (DCE) |
| Values: | | | |
| 0 | : | no flow control | |
| 2 | : | flow control by RTS control line (C105, Request to Send) | |
| <byDCE> | integer | 0 | specifies the method used by the device (DCE) to control the flow of data received from the DTE |
| Values: | | | |
| 0 | : | no flow control | |
| 2 | : | flow control by CTS control line (C105, Clear to Send) | |

i The only possible commands are **AT+IFC=0,0** and **AT+IFC=2,2**.

AT+IFC?

Read command returns active flow control settings.

AT+IFC=?

Test command returns all supported values of the parameters **<byDTE>** and **<byDCE>**.

3.2.4.12. AT+ICF - DTE-Modem Character Framing

This set command defines the asynchronous character framing.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+ICF=<format>[,<parity>]

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|----------|--------|---|---|
| <format> | string | 3 | sets the number of Data bits and Stop bits. Only the <format>=3 is supported. |
|----------|--------|---|---|

Value:

3 : 8 Data, 1 Stop

| | | | |
|----------|--------|---|--|
| <parity> | string | 0 | setting this sub parameter has no meaning. |
|----------|--------|---|--|

Values:

0 : odd, not supported

1 : even, not supported

AT+ICF?

Read command returns current settings for parameters <format> and <parity>. The setting of parameter <parity> is always 0.

AT+ICF=?

Test command returns the ranges of values for the parameters **<format>** and **<parity>**.

</> AT+ICF=3
OK

AT+ICF=?
+ICF: (3),(0,1)
OK

3.2.4.13. AT#SKIPESC - Skip Escape Sequence

This command enables/disables skipping the escape sequence.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#SKIPESC=[<mode>]

Set command enables/disables skipping the escape sequence (+++) while transmitting during a data connection.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | enable/disable skipping the escape sequence (+++) |

Values:

- 0 : does not skip the escape sequence; its transmission is enabled.
- 1 : skips the escape sequence; its transmission is not enabled.

-  In FTP connection the escape sequence is not transmitted, regardless of the command setting.

AT#SKIPESC?

Read command returns the current value of the parameter <mode> in the format:

#SKIPESC: <mode>

 **AT#SKIPESC=?**

Test command returns the supported values of parameter **<mode>**.

3.2.4.14. AT#SETHSTR - Enable Input of Hex Coded Characters in String Constants

This command allows the module to accept hexadecimal coded characters input in string constants.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SETHSTR=<mode>

Set command enables/disables the hexadecimal coded characters input style, depending on the <mode> parameter.

If enabled, hexadecimal characters are accepted as input when preceded by a backslash character and enclosed in double quotes.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | enable/disable input in hexadecimal format |

Values:

- 0 : input of hexadecimal coded characters is disabled
- 2 : input of hexadecimal coded characters is enabled. Each string constant containing a hexadecimal coded character must be enclosed between double-quotes. This is not mandatory if the string constant doesn't contain any hexadecimal coded character.

AT#SETHSTR?

Read command reports the current <mode> setting in the format:

#SETHSTR: <mode>

 **AT#SETHXSTR=?**

Test command reports the supported range of values for parameter

<mode>:

#SETHXSTR: (0,2)

AT#SETHXSTR=0

OK

AT+CGDCONT=1,"IP","nbiot.tids.tim.it"

OK

AT+CGDCONT=1,"IP","nb\69ot.tids.tim.it"

3.2.4.15. AT#E2ESC - Escape Sequence Guard Time

This set command sets a guard time in seconds for the escape sequence in PS to be considered a valid one, and return to on-line command mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#E2ESC=[<gt;]

Parameter:

| Name | Type | Default | Description |
|------|--------|---------|------------------------------|
| <gt; | string | 0 | sets a guard time in seconds |

Values:

0 : guard time is defined by S12 command

1÷10 : guard time in seconds. It overrides the one set with S12 command

AT#E2ESC?

Read command returns current value of the escape sequence guard time, in the format:

#E2ESC: <gt;

AT#E2ESC=?

Test command returns the range of supported values for parameter <gt;.

3.2.4.16. ATX - Extended Result Codes

Set command selects the subset of result code messages the modem uses to reply to the DTE upon AT commands execution.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

ATX[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | 1 | configuration value |

Values:

- 0 : when entering in dial mode a CONNECT result code is relayed; see Additional info.
- 1÷4 : when entering in dial mode a CONNECT <text> result code is relayed, see Additional info.

Additional info:

- ▶▶ <n>=0
OK, CONNECT, RING, NO CARRIER, ERROR, NO ANSWER result codes are enabled. Dial tone and busy detection (NO DIALTONE and BUSY result codes) are disabled.

<n>=1÷4
all the remaining result codes are enabled.

i When the `<n>` parameter is omitted, the command acts like `ATX0`.

3.2.5. Call (Voice and Data) Control

3.2.5.1. ATD - Dialup Connection

This command establishes a GPRS communication between the TE and the external PDN, or starts a voice call to a given phone number.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | Yes | - | 2 |

ATD

The **ATD** execution command assumes the format shown in Additional info section. It causes the MT to perform whatever actions are necessary to establish communication between the TE and the external PDN or to start a voice call to a given phone number.

Additional info:

▶▶ **ATD<number>;**

Execution command starts a voice call to the phone number given as parameter.

| Name | Type | Default | Description |
|----------|-------|---------|---|
| <number> | mixed | - | phone number to be dialed. The numbers accepted are 0-9 and '*', '#', 'A', 'B', 'C', 'D', '+', 'P', ','. |

▶▶ **ATD><str>;**

issues a call to phone number which corresponding alphanumeric field is <str>; all available memories will be searched for the correct entry.

| Name | Type | Default | Description |
|-------|--------|---------|---|
| <str> | string | - | alphanumeric field corresponding to phone number; it must be enclosed in quotation marks. Parameter <str> is case sensitive. |

►► **ATD><mem><n>;**

Issues a call to phone number in phonebook memory storage <mem>, entry location <n>. Available memories may be queried with **+CPBS=?** command.

| Name | Type | Default | Description |
|-------|--------|---------|--|
| <mem> | string | N/A | phonebook memory storage; it must not be enclosed in quotation marks |

Values:

SM : SIM phonebook

FD : SIM fixed dialing-phonebook

LD : SIM last-dialing-phonebook

MC : device missed (unanswered received) calls list

RC : ME received calls list

| | | | |
|-----|---------|---|--|
| <n> | integer | - | entry location; it should be in the range of locations available in the memory used. |
|-----|---------|---|--|

►► **ATD><n>;**

issues a call to phone number in entry location <n> of the active phonebook memory storage, see **+CPBS** command.

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | - | active phonebook memory storage entry location; it should be in the range of locations available in the active phonebook memory storage. |

▶▶ **ATDL**

issues a call to the last number dialed.

▶▶ **ATDS=<nr>;**

issues a call to the number stored in the module internal phonebook position number <nr>.

| Name | Type | Default | Description |
|------|---------|---------|--|
| <nr> | integer | - | internal phonebook position to be called, see commands &N and &Z |

▶▶ **ATD*<gprs_sc>[*<addr>][*<L2P>][*<cid>]]]]#**

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <gprs_sc> | integer | N/A | is the GPRS Service Code, which identifies a request to use the GPRS communication |

Value:

99 : GPRS Service Code

| | | | |
|--------|--------|---|---|
| <addr> | string | - | identifies the called party in the address space applicable to the PDP. |
| <L2P> | string | - | indicates the layer 2 protocol to be used (see +CGDATA). For communications software that |

| | | | |
|--------------------|---------|---|--|
| | | | does not support arbitrary characters in the dial string, the following numeric equivalents shall be used: 1 is equivalent to PPP. |
| <cid> | integer | - | PDP context definition, see +CGDCONT command |

3.2.5.2. ATA - Answer Incoming call

Execution command is used to answer to an incoming call if automatic answer is disabled.

ITU-T Recommendation V.25 ter
3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

ATA

-  This command must be the last in the command line and must be followed immediately by a <CR> character.
-  **Warning:** the "Not required" information contained in the "SIM Presence" field of the table, placed above the command syntax, must be replaced with "Required".

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.2.5.3. ATH - Hang Up/Disconnect the Current Call

This execution command hangs up/disconnects the current voice/data call or dial-up.

ITU-T Recommendation V.25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

ATH

-  When a data call or a dial-up is active the device is in on-line mode hence, to execute **ATH** command the device must be previously turned in command mode using the escape sequence or, if **&D1** option is active, tying Low the DTR pin.

3.2.5.4. ATO - Return to ON-Line Mode

This execution command is used, during a suspended data conversation, to return in on-line mode from command mode. If there is no suspended conversation, it returns **NO CARRIER**.

ITU-T Recommendation V. 25 ter

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

ATO

-  After issuing **ATO** command, the device returns in on-line mode. To enter again command-mode you must issue the escape sequence, see register **S2**.

3.2.5.5. AT#ATDCECHECK - ATD CE Level Check

AT command used to check CAT-M1 CE level before starting a VoLTE call

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ATDCECHECK=<enable>

Execution command enables/disables checking of CAT-M1 CE Mode A level before starting a VoLTE call; if check is enabled, VoLTE calls will not be attempted when CE level is 1. There is nothing in the standards that prevents the UE from setting up a VoLTE call while in CE mode, but in Level 1 it will fail: the network will try to allocate resources and set up the call, but the link will not support a bearer with the required throughput and latency requirements for VoLTE, so even if the call setup succeeds, voice will be unintelligible, and the link will eventually fail (drop).

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <enable> | integer | 0 | enables/disables checking of CAT-M1 CE Mode A level |

Values:

0 : disable check

1 : enable check

AT#ATDCECHECK?

Read command reports the current value of <enable> parameter in the format:

#ATDCECHECK: <enable>

AT#ATDCECHECK=?

Test command returns the current range of values for parameter <enable>.

Modules supporting the command

| | |
|----------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.2.5.6. AT#DIALMODE - Set Dialing Mode

Set command manages dialing modality.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#DIALMODE=[<mode>]

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|-----------------------|
| <mode> | integer | 0 | sets dialing modality |

Values:

- 0 : OK result code is received as soon as it starts remotely ringing.
- 1 : OK result code is received only after the called party answers.
- 2 : see Additional info section.

Additional info:

▶▶ <mode>=2

The following custom result codes are received, monitoring step by step the call status:

- 8. **DIALING**, MO in progress
- 9. **RINGING**, remote ring
- 10. **CONNECTED**, remote call accepted
- 11. **RELEASED**, after ATH
- 12. **DISCONNECTED**, remote hang-up

**AT#DIALMODE?**

Read command returns current **ATD** dialling mode in the format:

#DIALMODE: <mode>

**AT#DIALMODE=?**

Test command returns the supported range of values for parameter **<mode>**.

**Modules supporting the command**

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.2.6. Modulation & Compression Control

3.2.6.1. AT%E - Line Quality and Auto Retrain

This command is used for line quality monitoring and auto retrain or fall back/fall forward.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT%E[<n>]

Execution command has no effect and is included only for backward compatibility with landline modems.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | - | this parameter is not really used, and it is present only for backward compatibility |

- i** If <n> parameter is not specified, the default value is considered

3.3. Network

3.3.1. AT+CNUM - Subscriber Number

Execution command returns the MSISDN (if the phone number of the device has been stored in the SIM card)

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CNUM

Execution command returns the MSISDN (if the phone number of the device has been stored in the SIM card) using the following format:

+CNUM: <alpha>,<number>,<type>[<CR><LF>
+CNUM: <alpha>,<number>,<type>[...]]

The parameters are described in the Additional info section.

Additional info:

- ▶▶ List of the parameters meaning.

| Name | Type | Default | Description |
|----------|--------|---------|--|
| <alpha> | string | - | alphanumeric string associated to <number>; the character set depends on the value set with +CSCS. |
| <number> | string | - | numeric string containing the phone number in the format <type>. |

<type> integer N/A type of number.

Values:

129 : national numbering scheme

145 : international numbering scheme
(contains the character "+")

 **AT+CNUM=?**

Test command returns the **OK** result code.

3.3.2. AT+COPN - Read Operator Names

This command read operator names.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+COPN

Execution command returns the list of operator names from the ME in the format:

+COPN: <numeric1>,<alpha1>[<CR>

+COPN: <numeric2>,<alpha2>[...]]

The parameters are described in the Additional info section.

Additional info:

- ▶▶ List of the parameters meaning.

| Name | Type | Default | Description |
|-----------|--------|---------|--|
| <numeric> | string | - | operator in numeric format, see +COPS. |
| <alphan> | string | - | operator in long alphanumeric format, see +COPS. |

- i** Each operator code <numeric> that has an alphanumeric equivalent <alphan> in the ME memory is returned.

 **AT+COPN=?**

Test command returns the **OK** result code.

3.3.3. AT+CREG - Network Registration Status

The command enables/disables the network registration unsolicited result code (URC) and selects its presentation format.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CREG=[<mode>]

Set command enables/disables the network registration unsolicited result code and selects one of the two available formats:

short format: **+CREG: <stat>**

long format: **+CREG: <stat>[,<lac>,<ci>[,<AcT>]]**

The parameter meanings are shown in Unsolicited code value section.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | enables/disables the network registration unsolicited result code and selects one of the two formats: short or long format. <ol style="list-style-type: none"> 13. URC short format is displayed every time there is a change in the network registration status 14. URC long format is displayed every time there is a change of the network cell |

Values:

0 : disable the network registration unsolicited result code

- 1 : enable the network registration unsolicited result code, and selects the short format
- 2 : enable the network registration unsolicited result code, and selects the long format (includes the network cell identification data)

 Unsolicited fields:

| Name | Type | Description |
|---------------------|---------|---|
| <stat> | integer | network registration status of the module Values: 0 : not registered, terminal is not currently searching a new operator to register to 1 : registered, home network 2 : not registered, but terminal is currently searching a new operator to register to 3 : registration denied 4 : unknown 5 : registered, roaming |
| <lac> | string | the parameter reports: 15. Local Area Code when <AcT> =0 16. Tracking Area Code when <AcT> =8 or 9 |
| <ci> | string | Cell Id for the currently registered on cell |
| <AcT> | integer | access technology of the registered network Values: 0 : GSM 8 : CAT M1 9 : NB IoT |

-  **<lac>**, **<ci>** and **<AcT>** network information is reported by URC only if **<mode>=2**, and the module is registered on some network cell.

AT+CREG?

Read command returns the current value of **<mode>**, the registration status **<stat>**, and the network information (**<lac>**, **<ci>** and **<AcT>**) according to the used **<mode>** parameter value.

+CREG: <mode>,<stat>[,<lac>,<ci>[,<AcT>]]

<lac>, **<ci>**, and **<AcT>** network information is reported only if **<mode>=2** and the module is registered on some network cell.

AT+CREG=?

Test command returns supported values for parameter **<mode>**.

Check the registration status of the module.

AT+CREG?

+CREG: 0,2

OK

The module is in network searching state

...

...

Check again module status

AT+CREG?

+CREG: 0,1

OK

The module is registered

3.3.4. AT+COPS - Operator Selection

The command selects a network operator and registers the module.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+COPS=[<mode>[,<format>[,<oper>[,<act>]]]]

The set command attempts to select a network operator and registers the module on the just chosen operator; the selection can be automatic or manual.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | defines the operator selection: automatic or manual. |

Values:

- 0 : automatic selection, the parameter <oper> is ignored
- 1 : manual selection, the parameter <oper> must be present
- 2 : deregister from network. The module is unregistered until a +COPS with <mode>=0, 1 or 4 is issued
- 3 : set only <format> parameter, the parameter <oper> is ignored
- 4 : manual/automatic, <oper> parameter must be present. If manual selection fails, the module will tray automatic mode (<mode>=0)

| | | | |
|-----------------------|---------|---|---|
| <format> | integer | 0 | specifies the operator name format, see <oper> parameter |
|-----------------------|---------|---|---|

Values:

- 0 : alphanumeric long form (max length 16 digits)
- 1 : alphanumeric short form
- 2 : numeric 5 or 6 digits [country code (3) + network code (2 or 3)]

| | | | |
|---------------------|-------|---|---|
| <oper> | mixed | - | network operator in format defined by <format> parameter |
|---------------------|-------|---|---|

| | | | |
|--------------------|---------|-----|----------------------------|
| <act> | integer | N/A | selects access technology. |
|--------------------|---------|-----|----------------------------|

Values:

- 0 : GSM
- 8 : CAT M1
- 9 : NB IoT

-
- i** **<mode>** parameter setting is stored in NVM and available at next reboot. **<mode>=3** is not saved.
If **<mode>=1** or **4**, the selected network is stored in NVM too and is available at next reboot (this will happen also after inserting another SIM).
 - i** **<format>** parameter setting is never stored in NVM.
 - i** If **AT+COPS=0** is issued after the switch-on, it causes a new attempt to select a network operator and registers the module on the selected operator.

AT+COPS?

Read command returns current value of **<mode>**, **<format>**, **<oper>** and **<AcT>** in format **<format>**. If no operator is selected, **<format>**, **<oper>** and **<AcT>** are omitted.

+COPS: <mode>[, <format>, <oper>,< act>]

If the module is deregistered, **<format>**, **<oper>**, and **<act>** parameters are omitted.

AT+COPS=?

Test command returns a list of quadruplets, each representing an operator present in the network. The quadruplets list is ended with the range values of the **<mode>** and **<formats>** parameters.

The quadruplets in the list are closed between round brackets, separated by commas, the **<oper>** parameter is returned in both formats.

+COPS: [quadruplets list (<stat>,<oper (in <format>=0)>,<oper (in <format>=2)>,< act>), (<stat>,<oper (in <format>=0)>,<oper (in <format>=2)>,< act>), ...] [,(range of <mode>),(range of <format>)]

<stat> parameter is described in the Additional info section.

Additional info:

- ▶▶ Meaning of the **<stat>** parameter.

| Name | Type | Default | Description |
|---------------------|---------|-----------|-----------------------|
| <stat> | integer | N/A | operator availability |
| Values: | | | |
| 0 | : | unknown | |
| 1 | : | available | |
| 2 | : | current | |

3 : forbidden

- i** Since with this command a network scan is done, this command may require some seconds before the output is given.
-

3.3.5. AT+CLCK - Facility Lock/Unlock

This command is used to lock or unlock a **ME** on a network facility.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CLCK=<fac>,<mode>[,<password>[,<class>]]

Set command is used to lock, unlock or interrogate a modem or a network lock facility. Password is normally needed to do such actions

Parameters:

| Name | Type | Default | Description |
|---------------------|---------|----------------------------------|---|
| <fac> | string | N/A | facility to lock, unlock or interrogate |
| Values: | | | |
| "SC" | : | SIM (PIN request) | (device asks SIM password at power-up and when this lock command issued) |
| "FD" | : | SIM fixed dialing memory feature | (if PIN2 authentication has not been done during the current session, PIN2 is required as <passwd>) |
| <mode> | integer | N/A | defines the operation to be done on the facility |
| Values: | | | |
| 0 | : | unlock facility | |
| 1 | : | lock facility | |

 2 : query status

| | | | |
|-------------------------|---------|-----|--|
| <password> | string | - | shall be the same as password specified for the facility from the DTE user interface or with command Change Password +CPWD |
| <class> | integer | N/A | is a sum of integers, each representing an information class of which the command refers to; default is 7 (voice + data + fax). |

Values:

- 1 : voice (telephony)
 - 2 : data (refers to all bearer services)
 - 4 : fax (facsimile services) (not supported by LTE)
 - 8 : short message service
 - 16 : data circuit sync
 - 32 : data circuit async
 - 64 : dedicated packet access
 - 128 : dedicated PAD access
-

Additional info:

- ▶▶ When **<mode>=2** and command is successful, it returns:

+CLCK: <status>

| Name | Type | Default | Description |
|-----------------------|---------|---------|------------------------------------|
| <status> | integer | N/A | the current status of the facility |

Values:

- 0 : not active
-

1 : active

 **AT+CLCK=?**

Test command reports all the facilities supported by the device.

3.3.6. AT+CPWD - Change Facility Password

This command changes the password for the facility lock function defined by command Facility Lock **+CLCK** command.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | Yes | 180 s | 2 |

AT+CPWD=<fac>,<oldpwd>,<newpwd>

Execution command changes the password for the facility lock function defined by command Facility Lock **+CLCK** command.

Parameters:

| Name | Type | Default | Description |
|--------------------------|--------|---------|---|
| <fac> | string | N/A | facility lock function. |
| Values: | | | |
| "SC" : SIM (PIN request) | | | |
| "P2" : SIM PIN2 | | | |
| <oldpwd> | string | - | it shall be the same as password specified for the facility from the ME user interface or with command +CPWD . |
| <newpwd> | string | - | new password. |

- i** Parameter **<oldpwd>** is the old password while **<newpwd>** is the new one.
- i** The password can be changed only if PIN request is enabled (see **+CLCK** command).

A small icon of a microchip with a question mark to its left, indicating a test or diagnostic command.

AT+CPWD=?

Test command returns a list of pairs (<fac>,<pwdlength>) which represents the available facilities and the maximum length of their password (<pwdlength>).

3.3.7. AT+CLIR - Calling Line Identification Restriction

The command manages the CLIR service.

3GPP TS 27.007

3GPP TS 22.081

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CLIR=[<n>]

Set command overrides the CLIR subscription when temporary mode is provisioned as a default adjustment for all following outgoing calls. This adjustment can be revoked by using the opposite command. This command refers to CLIR service that allows a calling subscriber to enable or disable the presentation of the Calling Line Identification to the called party when originating a call.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------------------|
| <n> | integer | 0 | setting of CLIR service |

Values:

- 0 : CLIR facility according to CLIR service network status
- 1 : CLIR facility active (CLI not sent)
- 2 : CLIR facility not active (CLI sent)

This command sets the default behavior of the device in all outgoing calls.

 **AT+CLIR?**

Read command gives the default adjustment for all outgoing calls (<n>) and also triggers an interrogation of the provision status of the CLIR service (<m>), in the form

+CLIR: <n>,<m>

Additional info:

▶▶ Parameters:

| Name | Type | Default | Description |
|---------|---------|--|--------------------------------|
| <n> | integer | 0 | facility status in the Mobile |
| Values: | | | |
| 0 | : | CLIR facility according to CLIR service network status | |
| 1 | : | CLIR facility active (CLI not sent) | |
| 2 | : | CLIR facility not active (CLI sent) | |
| <m> | integer | N/A | facility status in the Network |
| Values: | | | |
| 0 | : | CLIR service not provisioned | |
| 1 | : | CLIR service provisioned permanently | |
| 2 | : | unknown (e.g. no network present) | |
| 3 | : | CLI temporary mode presentation restricted | |
| 4 | : | CLI temporary mode presentation allowed | |

 **AT+CLIR=?**

Test command reports the supported values of parameter <n>

| Modules Supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.3.8. AT+CLCC - List Current Calls

This command returns the list of current calls and their characteristics

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CLCC

Execution command returns the list of current calls and their characteristics in the format:

```
[+CLCC:<id1>,<dir>,<stat>,<mode>,<mpty>,<number>,<type>,<alpha>[<CR><LF>
+CLCC:<id2>,<dir>,<stat>,<mode>,<mpty>,<number>,<type>,<alpha>[...]]]
```

The parameters are described in the Additional info section.

Additional info:

- ▶ List of the parameters meaning.

| Name | Type | Default | Description |
|---------|---------|---------|----------------------------|
| <idn> | integer | - | call identification number |
| <dir> | integer | N/A | call direction |
| Values: | | | |
| | 0 | : | mobile originated call |
| | 1 | : | mobile terminated call |
| <stat> | integer | N/A | state of the call |

Values:

- 0 : active
- 1 : held
- 2 : dialing (MO call)
- 3 : alerting (MO call)
- 4 : incoming (MT call)
- 5 : waiting (MT call)

| | | | |
|---------------------|---------|-----|-----------|
| <mode> | integer | N/A | call type |
|---------------------|---------|-----|-----------|

Values:

- 0 : voice
- 1 : data
- 9 : unknown

| | | | |
|---------------------|---------|-----|----------------------|
| <mpty> | integer | N/A | multiparty call flag |
|---------------------|---------|-----|----------------------|

Values:

- 0 : call is not one of multiparty (conference) call parties
- 1 : call is one of multiparty (conference) call parties

| | | | |
|-----------------------|--------|---|---|
| <number> | string | - | phone number in format specified by <type> |
|-----------------------|--------|---|---|

| | | | |
|---------------------|---------|-----|--|
| <type> | integer | N/A | type of phone number octet in integer format |
|---------------------|---------|-----|--|

Values:

- 129 : national numbering scheme
- 145 : international numbering scheme (contains the character "+")

<alpha> string - alphanumeric representation of **<number>** corresponding to the entry found in phonebook; used character set should be the one selected with **+CSCS**

 If no call is active then only **OK** message is sent.

AT+CLCC=?

Test command returns **OK** result code

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.3.9. AT+CPOL - Preferred Operator List

The command is used to edit or update the UICC preferred list of networks. The list is read in the UICC file selected by the command **+CPLS**.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CPOL=[<index>]

[,<format>[,<oper>[,<GSM_AcT>,<GSM_Compact_AcT>,<UTRAN_AcT>,<E_UTRAN_AcTn>]]]

Execution command writes an entry in the UICC list of preferred operators.

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|---|
| <index> | integer | N/A | the order number of operator in the UICC preferred operator list. |
| Value: | | | |
| 1÷n : order number in the list | | | |
| <format> | integer | 2 | format for <oper> parameter. |
| Value: | | | |
| 2 : numeric. Only 2 is allowed up to now | | | |
| <oper> | string | - | Operator Identifier. |
| <GSM_AcT> | integer | N/A | GSM access technology. |
| Values: | | | |

0 : access technology not selected

1 : access technology selected

| | | | |
|--------------------------------|---------|-----|--|
| <GSM_Compact_Act> | integer | N/A | GSM compact access technology. Currently the parameter is not supported but set value is accepted. |
|--------------------------------|---------|-----|--|

Values:

0 : access technology not selected

1 : access technology selected

| | | | |
|--------------------------|---------|-----|--|
| <UTRAN_Act> | integer | N/A | UTRAN access technology. Currently the parameter is not supported but set value is accepted. |
|--------------------------|---------|-----|--|

Values:

0 : access technology not selected

1 : access technology selected

| | | | |
|-----------------------------|---------|-----|---------------------------|
| <E_UTRAN_Actn> | integer | N/A | E-UTRAN access technology |
|-----------------------------|---------|-----|---------------------------|

Values:

0 : access technology not selected

1 : access technology selected

- i** If **<index>** is used, and **<oper>** is not entered, the entry is deleted from the list of preferred operators.
- i** If **<oper>** is used, and **<index>** is not used, **<oper>** is put in the next free location.
- i** If only **<format>** is entered, the format of the **<oper>** in the read command is changed.

**AT+CPOL?**

Read command returns all used entries from the UICC list of preferred operators.

**AT+CPOL=?**

Test command returns the <index> range supported by the UICC and the range for the <format> parameter.

Entry 3 in the preferred list of the operators is deleted.

```
AT+CPOL=3  
OK
```

Operator identifier 22603 is inserted in the next free location of the list.

```
AT+CPOL=,2,22603  
OK
```

Format of <oper> in the read command is changed (only 2 is allowed up to now).

```
AT+CPOL=,2  
OK
```

Operator Identifier 22603 is inserted in the 4th position of the list.

```
AT+CPOL=4,2,22603  
OK
```

Available range for <index> is 1 to 20, for <format>= 2.

```
AT+CPOL=?  
+CPOL: (1-20),(2)
```

3.3.10. AT+CPLS - Selection of Preferred PLMN List

The command is used to select a list of preferred PLMNs in the SIM/USIM card.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CPLS=<list>

Set command select one PLMN selector with Access Technology list in the SIM card or active application in the UICC (GSM or USIM), that is used by +CPOL command.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------|
| <list> | integer | 0 | PLMNs list selector |

Values:

- 0 : User controlled PLMN selector with Access Technology EFPLMNwAcT, if not found in the SIM/UICC then PLMN preferred list EFPLMNsel (this file is only available in SIM card or GSM application selected in UICC)
- 1 : Operator controlled PLMN selector with Access Technology EFOPLMNwAcT
- 2 : HPLMN selector with Access Technology EFHPLMNwAcT

- i** The value set by command is directly stored in NVM and doesn't depend on the specific CMUX instance.

**AT+CPLS?**

Read command returns the selected PLMN selector **<list>** from the SIM/USIM.

**AT+CPLS=?**

Test command returns the whole index range supported **<list>s** by the SIM/USIM.

3.3.11. AT+CSQ - Signal Quality

Execution command returns received signal strength indication **<rssi>** and channel bit error rate **<ber>** from the MT.

- [1] 3GPP TS 27.007
- [2] 3GPP TS 07.07
- [3] 3GPP TS 25.133

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CSQ

See Additional info sections.

Additional info:

▶▶ [2G Networks](#)

The execution command returns the following message:

+CSQ: <rssi>,<ber>

| Name | Type | Default | Description |
|---------------------|---------|---------|--|
| <rssi> | integer | N/A | measurements of the radio signal power, expressed in dBm, are mapped to <rssi> as shown below |

Values:

0 : -113 dBm or less

1 : -111 dBm

2÷30 : -109 dBm ... -53 dBm; 2 dBm per step

31 : -51 dBm or greater

99 : not known or not detectable

<ber> integer N/A measurements of the channel bit error rate, expressed in %, are mapped to **<ber>** as shown below

Values:

0 : less than 0.2%

1 : 0.2% to 0.4%

2 : 0.4% to 0.8%

3 : 0.8% to 1.6%

4 : 1.6% to 3.2%

5 : 3.2% to 6.4%

6 : 6.4% to 12.8%

7 : more than 12.8%

99 : not known or not detectable

►► 4G Networks

The execution command returns the following message:

+CSQ: <rssi>,<rsrq>

| Name | Type | Default | Description |
|---------------------|---------|---------|---|
| <rssi> | integer | N/A | Received Signal Strength Indication. For <rssi> to be compliant with 3GPP TS27.007 specification, levels are mapped to range 0...31. |

Values:

| | | |
|------|---|-----------------------------|
| 0 | : | -113 dBm or less |
| 1 | : | -111 dBm |
| 2÷30 | : | -109...-53 dBm |
| 31 | : | - 51 dBm or greater |
| 99 | : | not known or not detectable |

| | | | |
|---------------------|---------|-----|--|
| <rsrq> | integer | N/A | Reference Signal Received Quality. For <rsrq> levels are mapped to range 0...7. |
|---------------------|---------|-----|--|

Values:

| | | |
|----|---|-----------------------------|
| 0 | : | -4...-3 dB |
| 1 | : | -6...-5 dB |
| 2 | : | -8...-7 dB |
| 3 | : | -10...-9 dB |
| 4 | : | -13...-11 dB |
| 5 | : | -15...-14 dB |
| 6 | : | -17...-16 dB |
| 7 | : | -19...-18 dB |
| 99 | : | not known or not detectable |

AT+CSQ=?

Test command returns values supported as compound values.

3.3.12. AT#SERVINFO - Serving Cell Information

This command reports information about the serving cell.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SERVINFO

Execution command reports information about serving cell. The information and the format of the returned message depends on the network type.

GSM network

```
#SERVINFO:<BARFCN>,<dBM>,[<NetNameAsc>],<NetCode>,<BSIC>,<LAC>,<TA>,<GPRS>[,<PBARFCN>],[<NOM>],<RAC>,[PAT]]
```

LTE network

```
#SERVINFO:<EARFCN>,<dBM>,[<NetNameAsc>],<NetCode>,<PhysicalCellId>,<TAC>,<DRX>,<SD>,<RSRP>
```

The parameters are described in the Additional info sections.

Additional info:

- ▶ Parameters meaning.

| Name | Type | Default | Description |
|--------------|---------|---------|--|
| <dBM> | integer | - | received signal strength in dBm. |
| <NetNameAsc> | string | - | operator name, quoted string or "" if network name is unknown. |
| <NetCode> | hex | - | country code and operator code. |
| <LAC> | integer | - | Localization Area Code |
| <BSIC> | string | - | Base Station Identification Code |

| | | | |
|-------------------|---------|---|---|
| <TA> | integer | - | Time Advance: it is available only if a GSM or GPRS is running. |
| <GPRS> | integer | 0 | GPRS supported in the cell |
| Values: | | | |
| 0 : not supported | | | |
| 1 : supported | | | |
| <BARFCN> | integer | - | BCCH ARFCN of the serving cell |

►► Parameters meaning.

| Name | Type | Default | Description |
|------------------------|---------|---------|--------------------------|
| <NOM> | string | N/A | Network Operator Mode. |
| Values: | | | |
| I : Network Mode I | | | |
| II : Network Mode II | | | |
| III : Network Mode III | | | |
| <RAC> | integer | - | Routing Area Color Code. |

►► Parameters meaning.

| Name | Type | Default | Description |
|----------------|---------|---------|---------------------------------------|
| <DRX> | integer | - | Discontinuous reception cycle length. |
| <SD> | integer | N/A | Service Domain |
| Values: | | | |
| 0 : No Service | | | |

1 : CS only

2 : PS only

3 : CS & PS

| | | | |
|------------------|---------|---|------------------------------------|
| <RSCP> | integer | - | Received Signal Code Power in dBm. |
| <EARFCN> | integer | - | LTE Assigned Radio Channel |
| <PhysicalCellId> | integer | - | Physical Cell ID |
| <TAC> | integer | - | Tracking Area Code |
| <RSRP> | integer | - | Reference Signal Received Power |

►► Parameters meaning.

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <PBARFCN> | integer | - | Not supported by 3GPP. PBCCH ARFCN of the serving cell; it is printed only if PBCCH is supported by the cell, otherwise the label " hopping " will be printed |
| <PAT> | integer | N/A | Priority Access Threshold. |

Values:

0 : Priority Access Threshold

3÷6 : Priority Access Threshold

? AT#SERVINFO=?

Test command returns **OK** result code.

3.3.13. AT#BCCHLOCK - Lock to Single BCCH ARFCN

This command enables/disable the single BCCH ARFCN locking.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#BCCHLOCK=<LockedBcch>[,<LockedUarfcn>[,<LockedPsc>[,<LockedEarfcn>[,<LockedPci>]]]]**

This command allows to set the single BCCH ARFCN (also UARFCN and EARFCN) the device must be locked to, selectable within those allowed for the specific product.

Parameters:

| Name | Type | Default | Description |
|----------------|---------|---------|---|
| <LockedBcch> | integer | 1024 | enable/disable 2G BCCH locking |
| | Value: | 1024 | : disable |
| <LockedUarfcn> | integer | 0 | enable/disable 3G BCCH locking |
| | Value: | 0 | : disable |
| <LockedPsc> | integer | 65535 | enable/disable 3G BCCH locking Primary Scrambling Code selection |
| | Value: | 65535 | : disable |
| <LockedEarfcn> | integer | 0 | a number representing the earfcn to be locked. If <LockedPci> is FFFF, this value must be 0 |
| | Value: | | |

0÷70545 : enable lock on downlink EARFCN in LTE bands (some values are not supported according to product band configuration).

| | | | |
|-------------|-----|------|---|
| <LockedPci> | hex | FFFF | E-UTRAN physical cell ID in hexadecimal format. Valid range 0 - 1F7. The value FFFF will remove the lock. |
|-------------|-----|------|---|

Values:

0÷1F7 : physical cell id

FFFF : disable

- i** The values set by command are directly stored in NVM. The lock feature is effective at the next attach. Reboot is required for unlock function and when the lock is set on a different cell than the current one.

AT#BCCHLOCK?

Read command reports the currently stored parameters in the format:

#BCCHLOCK:
<LockedBcch>,<LockedUarfcn>,<LockedPsc>,<LockedEarfcn>,<LockedPci>

AT#BCCHLOCK=?

Test command reports the supported range of values for parameter:

<LockedBcch>,<LockedUarfcn>,<LockedPsc>,<LockedEarfcn> and <LockedPci>

3.3.14. AT#NWEN - Network Emergency Number Update

This command enables the unsolicited result code of emergency number update.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT#NWEN=[<en>]

Set command enables/disables the URC for emergency number update.
The URC format is:

#NWEN: <type>

The parameter is described in the Unsolicited field section.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <en> | integer | 0 | enables/disables unsolicited indication of emergency number update |

Values:

0 : disable

1 : enable

Unsolicited field:

| Name | Type | Description |
|--------|---------|---|
| <type> | integer | unsolicited indication of emergency number update |

Values:

1 : number list update from internal ME

2 : number list update from SIM

3 : number list update from network

 Entering **AT#NWEN=** returns **OK** but has no effect.

AT#NWEN?

Read command reports whether the unsolicited indication of network emergency number update is currently enabled or not, in the format:

#NWEN: <en>

AT#NWEN=?

Test command reports the range for the parameter **<en>**

3.3.15. AT#PLMNUPDATE - Update PLMN List

This set command adds a new entry, or updates an already present one, in the module PLMN list stored in file system.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#PLMNUPDATE[<action>,<MCC>,<MNC>[,<PLMNname>]]

Parameters:

| Name | Type | Default | Description |
|------------|---------|---|---|
| <action> | integer | 0 | remove/update PLMN list items |
| Values: | | | |
| 0 | : | remove the entry with selected <MCC> and <MNC>. Parameter <PLMNname> is ignored | |
| 1 | : | update the entry with selected <MCC> and <MNC> if it is already present, otherwise add it | |
| <MCC> | integer | - | Mobile Country Code |
| <MNC> | integer | - | Mobile Network Code |
| <PLMNname> | string | - | name of the PLMN; string value, max length 30 characters. |

- i** #PLMNUPDATE command is accepted only if #PLMNMODE is set to 2.

AT#PLMNUPDATE?

Read command returns the list of entries added or updated with set command, in the format:

```
#PLMNUPDATE: <MCC>,<MNC>,<PLMNname>
```

```
#PLMNUPDATE: <MCC>,<MNC>,<PLMNname>
```

```
...
```

```
OK
```

The entries are listed in increasing order by MCC and MNC.

AT#PLMNUPDATE=?

Test command returns the range of **<action>** parameter and the maximum length of **<MCC>**, **<MNC>** and **<PLMNname>** parameters.

3.3.16. AT#PLMNMODE - PLMN List Selection

Set command is used to select the list of operator names to be used in **+COPN** command, and in internal researches for operator name matching given MCC and MNC.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#PLMNMODE=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 1 | list of operator names to be used for internal search |

Values:

- 1 : internal hard coded list
- 2 : list is retrieved from a file in the file system

AT#PLMNMODE?

Read command reports whether the currently used list of PLMN names is fixed or not, in the format:

#PLMNMODE: <mode>

AT#PLMNMODE=?

Test command returns the supported range of values for parameter <mode>.

3.3.17. AT#FPLMN - Periodical FPLMN Cleaning

Periodically delete the Forbidden PLMN list stored inside the SIM card, clear it or list it.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#FPLMN=<action>[,<period>]

The set command is used to manage the Forbidden PLMN List file (FPLMN) stored in the SIM card.

Parameters:

| Name | Type | Default | Description |
|----------|---------|---|--|
| <action> | integer | 0 | kind of action for FPLMN file |
| Values: | | | |
| 0 | : | disable periodic FPLMN cleaning | |
| 1 | : | enable periodic FPLMN cleaning with period <period> | |
| 2 | : | clear FPLMN file contents (one shot) | |
| 3 | : | list contents of FPLMN file | |
| <period> | integer | 60 | interval in minutes for FPLMN clearing |
| Value: | | | |
| 1÷60 | : | interval in minutes | |

AT#FPLMN?

Read command reports whether the periodic deletion is currently enabled or not, and the deletion period, in the format:

#FPLMN: <action>,<period>

 **AT#FPLMN=?**

Test command reports available values for parameters **<action>** and **<period>**

3.3.18. AT#BND - Select Band

This command selects RF bands

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#BND=<band>[,<UMTS_band>[,<LTE_band>[,<TDSCDMA_band>[,<LTE_band_over_64>]]]]**

Set command selects the current GSM and LTE (CATM and NBlot) bands. CATM and NBlot bands are set to the same <LTE_band> and <LTE_band_over_64> values.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------|
| <band> | integer | - | GSM band selection. |

For 4G only products:

| <band> | / |
|--------|-----------------|
| 0 | dummy parameter |

For 4G/2G products supporting GSM 900 MHz, DCS 1800 MHz, PCS 1900 MHz and GSM 850 MHz:

| <band> | GSM bands |
|--------|--------------------------|
| 0 | GSM 900MHz + DCS 1800MHz |
| 1 | GSM 900MHz + PCS 1900MHz |
| 2 | GSM 850MHz + DCS 1800MHz |

| | |
|---|--|
| 3 | GSM 850MHz + PCS 1900MHz |
| 4 | GSM 900MHz + DCS 1800MHz + PCS 1900MHz |
| 5 | GSM 900MHz + DCS 1800MHz + PCS 1900MHz + GSM 850MHz |

<UMTS_band> integer 0 this parameter is used for backward compatibility.

Value:

0 : for both 4G only and 4G/2G products.

<LTE_band> integer N/A indicates the LTE supported bands expressed as the sum of Band number (1+2+8 ...) calculated as shown in the table (mask of 32 bits):

| Band number | Band i |
|-----------------|--------|
| 1 | B1 |
| 2 | B2 |
| 4 | B3 |
| 8 | B4 |
| ... | ... |
| $2^{\exp(i-1)}$ | Bi |
| ... | ... |
| 2147483648 | B32 |

Value:

1÷4294967295 : range of the sum of Band number (1+2+8 ...)

<TDSCDMA_band> integer 0 this parameter is used for backward compatibility

Value:

0 : for both 4G only and 4G/2G products

<LTE_band_over_64> integer N/A indicates the LTE high supported bands expressed as the sum of Band number (1+2+8 ...) calculated as shown in the table (mask of 32 bits):

| Band number | Band i |
|----------------------|--------|
| 1 | B65 |
| 2 | B66 |
| 4 | B67 |
| 8 | B68 |
| ... | ... |
| $(2^{\exp(i-64-1)})$ | Bi |
| ... | ... |

Values:

0 : no high band selected

1÷4294967295 : range of the sum of Band number (1+2+8 ...)

 The command needs a reboot to be effective.

AT#BND?

Read command returns the current selected bands in the format:

#BND: <band>,<UMTS_band>,<LTE_band>,< TDSCDMA_band>,< LTE_band_over_64>

AT#BND=?

Test command returns the supported range of values of parameters <band>, <UMTS_band>, <LTE_band>, <TDSCDMA_band> and <LTE_band_over_64>.

Test command

```
AT#BND=?
```

```
#BND: (0-5),(0),(4-524420),(1-252655775),(0),(0,2-1048642)
```

```
OK
```

Read command

```
AT#BND?
```

```
#BND: 5,0,524420,252655775,0,1048642
```

```
OK
```

3.3.19. AT#BNDPRIEXT - Band Priority Setting

Set command configures the CAT-M1 and NB-IoT bands scanning priority in dedicated EFS file.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#BNDPRIEXT=<high_priority_bands_CATM>[,<high_priority_bands_NB>]**

Parameters:

| Name | Type | Default | Description |
|----------------------------|--------|---------|---|
| <high_priority_bands_CATM> | string | - | hexadecimal string indicating a sequence of maximum 43 bands, each one two bytes long; a special value of 0 is used to indicate that file must be deleted |
| <high_priority_bands_NB> | string | - | hexadecimal string indicating a sequence of maximum 43 bands, each one two bytes long; a special value of 0 is used to indicate that file must be deleted |

 Command needs a reboot to be effective.

 **AT#BNDPRIEXT?**

Read command returns the current parameters setting for **#BNDPRIEXT** command in the format:

#BNDPRIEXT: <high_priority_bands_CATM>,<high_priority_bands_NB>

 **AT#BNDPRIEXT=?**

Test command returns **OK** result code.

 Examples of **#BNDPRIEXT** usage

- **AT#BNDPRIEXT=0C0004000200,0C0004000200**
OK

- **AT#BNDPRIEXT=0,0C0004000200**
OK

- **AT#BNDPRIEXT=0C0004000200,0**
OK

- **AT#BNDPRIEXT=0,0**
OK

3.3.20. AT#AUTOBND - Automatic Band Selection

This command has no effect and is included only for backward compatibility.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#AUTOBND=[<value>]

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|----------------------------------|
| <value> | integer | 0 | only for backward compatibility. |

Values:

- 0 : only for backward compatibility.
- 1 : only for backward compatibility.
- 2 : only for backward compatibility.

AT#AUTOBND?

Read command returns the current value of the parameter <value> in the format:

#AUTOBND: <value>

AT#AUTOBND=?

Test command returns the supported values for parameter <value>.

3.3.21. AT#ATUNERSEL - Select Antenna Tuner

This command allows to select the antenna tuner driver.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ATUNERSEL=<driver>

Set command selects the antenna tuner driver.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <driver> | integer | 0 | Identifies one of the possible antenna tuner driver. |

Values:

- 0 : GPIO with fixed configuration (default) - 2 I/O to select 4 output bands status combination. (See table in Additional info).
- 1 : MIPI with QAT3516 + AE910 Antenna Tuner Product . See #BNDTUNER command for further details about antenna tuner configuration.

Additional info:

▶▶ Table for <driver> = 1

| GRFC1 | GRFC2 | Band (Uplink) | Freq. Range (MHz) |
|-------|-------|--|-------------------|
| 0 | 0 | B1, B2, B3, B4, B25, B66, GSM1800, GSM1900 | 1710-2200 |
| 0 | 1 | B8, EGSM900 | 880-960 |

| | | | |
|---|---|---|---------|
| 1 | 0 | B5, B18, B19, B20, B26, B27, GSM850 | 791-894 |
| 1 | 1 | B12, B13, B28, B85 | 698-803 |

 The command reboots the module to make the change effective.

AT#ATUNERSEL?

Read command reports the currently selected aperture antenna tuning driver selection, in the format:

#ATUNERSEL: <driver>

AT#ATUNERSEL=?

Test command reports the range for the parameter **<driver>**.

3.3.22. AT#BNDTUNER - Antenna Tuner Configuration

This command set antenna tuner configuration on selected band. Reboot is required to be effective. Command is supported only by a subset of modules when **AT#ATUNERSEL=1** is available and set

- Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#BNDTUNER=<TunerType>,<Deviceld>,<Band>,<TuneCode>[,<Unused1>[,<Unused2>[,<Unused3>]]]**

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--|
| <TunerType> | integer | 0 | Select the tuner under configuration. Allowed valued depends on specific hardware |
| Values: | | | |
| 0 : Default | | | |
| 1 : Antenna Tuner QAT3516 | | | |
| <Deviceld> | integer | 0 | Hardware identifier to detect device on Hardware. Allowed value depends on specific hardware |
| Value: | | | |
| 0 : Only identifier 0 is currently allowed | | | |
| <Band> | integer | - | Band under tuning. To know the range, see #BND command. |

| | | | |
|------------|---------|---|--|
| <TuneCode> | string | - | String containing Hex Value used to configure the antenna tuner. Size of the string and constraints depend on specific tuner (see Additional info) |
| <Unused1> | integer | - | Reserved for future use |
| <Unused2> | integer | - | Reserved for future use |
| <Unused3> | integer | - | Reserved for future use |

Additional info:

►► TuneCode configuration:

QAT3516: it requires a 4-char string which contains 2 byte value in HEX format (i.e.: "E1080")

Following QAT3516 constraints, the string has this general representation: "xx8y" where:

Value x can assume any Hex value from 0 to F

Value y can assume only value from 0 to 3

AT#BNDTUNER?

Read command reports the current settings of parameters, in the format:

#BNDTUNER: <Band>,<Deviceld>,<TuneCode>

#BNDTUNER: <Band>,<Deviceld>,<TuneCode>

#BNDTUNER: <Band>,<Deviceld>,<TuneCode>

...

AT#BNDTUNER=?

Test command reports the supported range of the parameters' values

Modules supporting the command

```

```
OK
```

3.3.23. AT#SNUM - Subscriber Number

This set command writes the MSISDN information related to the subscriber (own number) in the EFmsisdn SIM file.

3GPP TS 51.011

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SNUM=<index>[,<number>[,<alpha>]]

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <index> | integer | - | the number of the record in the EFmsisdn file in SIM where the number must be stored; its range goes from 1 to a maximum value that varies from SIM to SIM. If only <index> value is given, then the EFmsisdn record in location <index> is deleted. |
| <number> | string | - | string containing the phone number |
| <alpha> | string | - | alphanumeric string associated to <number>; its maximum length varies from SIM to SIM. Default value is empty string (""), otherwise the used character set should be the one selected with +CSCS. The string could be written between quotes; the number of characters depends on the SIM. If empty string is given (""), the corresponding <alpha> will be an empty string. |

-
-  The command returns **ERROR** if EFmsisdn file is not present in the SIM, or if MSISDN service is not allocated and activated in the SIM Service Table, see 3GPP TS 51.011.

 **AT#SNUM=?**

Test command returns the **OK** result code

3.3.24. AT#CODECINFO - Codec Information

This command returns information about the channels codecs.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CODECINFO[=<format>[,<mode>]]

This command is a set or an execution command. It enables/disables unsolicited channel codec information reports, or returns the channel codec info, in both case according to the specified format.

Set command format:

AT#CODECINFO=<format>,<mode>

Execution command format:

AT#CODECINFO

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|---------|--|
| <format> | integer | 0 | select the return information format: numeric or textual |

Values:

0 : numeric format, see info section

1 : textual format, see info section

| | | | |
|---------------------|---------|---|--|
| <mode> | integer | 0 | enable/disable unsolicited channels codecs information |
|---------------------|---------|---|--|

Values:

0 : disable the URC of the channels codecs information, see info section

1 : enable the URC of the channels codecs information only if the codec changes, see info section

- 2 : enable the short URC of the channels codecs information only if the codec changes, see info section

Additional info:

- ▶▶ **<mode>=1**, the URC of the channels codecs information is displayed according to the **<format>** parameter value:

if **<format>=0**, the URC is:

#CODECINFO: <codec_used>,<codec_set>

if **<format>=1**, the URC is:

#CODECINFO:

<codec_used>,<codec_set1>[,<codec_set2>[..[,codec_setn]]]

- ▶▶ **<mode>=2** the short URC of the channels codecs information is displayed as shown below:

#CODECINFO: <codec_used>

The **<codec_used>** format depends on the **<format>** parameter value.

- ▶▶ Execution command (**AT#CODECINFO<CR>**) returns immediately channels codecs information according to the previous setting of **<format>** parameter.

if **<format>=0**, the return message is:

#CODECINFO: <codec_used>,<codec_set>

if **<format>=1**, the return message is:

#CODECINFO:

<codec_used>,<codec_set1>[,<codec_set2>[..[,codec_setn]]]

The parameters and their format is described in the Unsolicited code values section.

Unsolicited fields:

| Name | Type | Description |
|---------------------------------|--------|--|
| <code><codec_used></code> | string | <p><code><format>=0</code>, <code><codec_used></code> is displayed in numeric format</p> <p>Values:</p> <ul style="list-style-type: none"> 0 : no TCH 1 : full rate speech 1 on TCH 2 : full rate speech 2 on TCH 4 : half rate speech 1 on TCH 8 : full rate speech 3 – AMR on TCH 16 : half rate speech 3 – AMR on TCH 128 : full data 9.6 129 : full data 4.8 130 : full data 2.4 131 : half data 4.8 132 : half data 2.4 133 : full data 14.4 134 : full rate AMR wide band 135 : UMTS AMR version 2 136 : UMTS AMR wide band |
| <code><codec_set></code> | string | <p><code><format>=0</code>, <code><codec_set></code> is displayed in numeric format. It is the sum of integers each representing a specific channel codec.</p> <p>channel codec:</p> <ul style="list-style-type: none"> 1 - FR, full rate mode enabled 2 - EFR, enhanced full rate mode enabled 4 - HR, half rate mode enabled |

- 8 - FAMR, AMR full rate mode enabled
- 16 - HAMR, AMR half rate mode enabled
- 32 - FR-AMR-WB, full rate AMR wide band
- 64 - UMTS-AMR-V2, UMTS AMR version 2
- 128 - UMTS-AMR-WB, UMTS AMR wide band

Value:

1..255 : sum of integers each representing a specific channel codec

<codec_used> string **<format>=1**, **<codec_used>** is displayed in textual format

Values:

- None : no TCH
 - FR : full rate speech 1 on TCH
 - EFR : full rate speech 2 on TCH
 - HR : half rate speech 1 on TCH
 - FAMR : full rate speech 3 – AMR on TCH
 - HAMR : half rate speech 3 – AMR on TCH
 - FD96 : full data 9.6
 - FD48 : full data 4.8
 - FD24 : full data 2.4
 - HD48 : half data 4.8
 - HD24 : half data 2.4
 - FD144 : full data 14.4
 - FAWB : full rate AMR wide band
 - UAMR2 : UMTS AMR version 2
 - UAWB : UMTS AMR wide band
-

<codec_setn> string **<format>=1**, **<codec_setn>** are displayed in textual format

Values:

FR : full rate mode enabled
 EFR : enhanced full rate mode enabled
 HR : half rate mode enabled
 FAMR : AMR full rate mode enabled
 HAMR : AMR half rate mode enabled
 FAWB : full rate AMR wide band
 UAMR2 : UMTS AMR version 2
 UAWB : UMTS AMR wide band

- i** The command refers to codec information in speech call, and to channel mode in data call.
- i** If **AT#CODEC=0**, the reported channels codecs set, for **<format>=0**, is 255 (all codecs).

AT#CODECINFO?

Read command reports **<format>** and **<mode>** parameter values in the format:

#CODECINFO: <format>,<mode>

AT#CODECINFO=?

Test command returns the range of supported **<format>** and **<mode>** parameters values.

Modules supporting the command

| | |
|----------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.3.25. AT#CEERNET - Extended Numeric Error Report for Network Reject Cause

The command is related to extended numeric error report.

3GPP TS 24.008

3GPP TS 24.301

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#CEERNET

Execution command causes the TA to return a numeric code in the intermediate response format:

#CEERNET: <code>

which should offer the user of the TA a report for the last mobility management (MMGMM/EMM) or session management (SM/ESM) procedure not accepted by the network.

Additional info:

- ▶▶ 17. The following error codes are valid for mobility management (MM/GMM) or session management (SM), i.e. for 2G and 3G networks.
- 18. In 4G network the <code>s meanings are included in tables 9.9.4.4.1 (for ESM causes) and 9.9.3.9.1 (for EMM cause) of 3GPP TS 24.301 Release 9.

| Name | Type | Default | Description |
|--------|---------|---------|-------------|
| <code> | integer | N/A | error code |

Values:

-
- 2 : IMSI unknown in HLR
 - 3 : illegal MS
 - 4 : IMSI unknown in VISITOR LR
 - 5 : IMEI not accepted
 - 6 : illegal ME
 - 7 : GPRS not allowed
 - 8 : Operator determined barring (SM cause failure)/ GPRS and not GPRS not allowed (GMM cause failure)
 - 9 : MS identity cannot be derived by network
 - 10 : implicitly detached
 - 11 : PLMN not allowed
 - 12 : LA not allowed
 - 13 : roaming not allowed
 - 14 : GPRS not allowed in this PLMN
 - 15 : no suitable cells in LA
 - 16 : MSC TEMP not reachable
 - 17 : network failure
 - 20 : MAC failure
 - 21 : SYNCH failure
 - 22 : congestion
 - 23 : GSM authentication unacceptable
 - 24 : MBMS bearer capabilities insufficient for the service
-

-
- 25 : LLC or SNDCP failure
 - 26 : insufficient resources
 - 27 : missing or unknown APN
 - 28 : unknown PDP address or PDP type
 - 29 : user authentication failed
 - 30 : activation rejected by GGSN
 - 31 : activation rejected unspecified
 - 32 : service option not supported
 - 33 : req. service option not subscribed
 - 34 : serv. option temporarily out of order
 - 35 : NSAPI already used
 - 36 : regular deactivation
 - 37 : QOS not accepted
 - 38 : call cannot be identified (MM cause failure) /
SMN network failure (SM cause failure)
 - 39 : reactivation required
 - 40 : no PDP context activated (GMM cause
failure) / feature not supported (SM cause
failure)
 - 41 : semantic error in TFT operation
 - 42 : syntactical error in TFT operation
 - 43 : unknown PDP context
 - 44 : semantic err in PKT filter
 - 45 : syntactical err in PKT filter
-

-
- 46 : PDP context without TFT activated
 - 47 : multicast group membership timeout
 - 48 : retry on new cell begin (if MM cause failure) /
activation rejected BCM violation (if SM
cause failure)
 - 50 : PDP type IPV4 only allowed
 - 51 : PDP type IPV6 only allowed
 - 52 : single address bearers only allowed
 - 63 : retry on new cell end
 - 81 : invalid transaction identifier
 - 95 : semantically incorrect message
 - 96 : invalid mandatory information
 - 97 : MSG type non-existent or not implemented
 - 98 : MSG type not compatible with protocol state
 - 99 : IE non-existent or not implemented
 - 100 : conditional IE error
 - 101 : MSG not compatible with protocol state
 - 111 : protocol error unspecified
 - 112 : APN restriction value incompatible with
active PDP context
-

 Telit recommends that the host controlling the modem defines the proper retry/reboot scheme for reject causes 2, 7, 11, 14, 30, 33, 34, 38.

AT#CEERNET=?

Test command returns **OK** result code.

3.3.26. AT#CEERTEXT - Extended Error Report for Network Reject Cause

This command is both a set and an execution command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CEERTEXT[=[<func>]]

Set command enables/disables the URC presentation or deletes the last network information. The execution command (AT#CEERTEXT<CR><LF>) gets the last reject error information from the network and returns the following message:

#CEERTEXT: <code>,<AcT>,<MCC>,<MNC>

If no error information is present, the execution command returns **OK**. When URC is enabled, it will occur every time a mobility management (MM/GMM/EMM) or session management (SM/ESM) procedure is not accepted by the network.

The URC message is equal to the message returned by the execution command.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <func> | integer | 0 | enable/disable the URC or delete the last network info |

Values:

- 0 : disable the #CEERTEXT URC
- 1 : enable the #CEERTEXT URC
- 2 : delete last info of <code>, <AcT>, <MCC> and <MNC>

Unsolicited fields:

| Name | Type | Description |
|------|------|-------------|
|------|------|-------------|

| | | |
|---------------------|---------|--|
| <code> | integer | last numeric Network Reject Cause from network, see <code> in #CEERNET |
| <AcT> | integer | access technology of the registered network |
| | | Values: |
| | 0 | : GSM |
| | 8 | : CAT-M |
| | 9 | : NB-IoT |
| <MCC> | string | Mobile Country Code of the used network when last numeric code was received |
| <MNC> | string | Mobile Network Code of the used network when last numeric code was received |

AT#CEERNETEXT?

The read command returns the current value of parameter **<func>** in the format:

#CEERNETEXT: <func>

Additional info:

- ▶ Parameters returned by the read command.

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|---------------------|---------|-----|----------------------------------|
| <func> | integer | N/A | can assume the following values: |
|---------------------|---------|-----|----------------------------------|

Values:

0 : #CEERNETEXT URC is disabled

1 : #CEERNETEXT URC is enabled

AT#CEERTEXT=?

Test command reports the supported range of values for the **<func>** parameter.

3.3.27. AT#CIPHIND - Ciphering Indication

This command enables/disables unsolicited result code for cipher indication.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#CIPHIND=[<mode>]

Set command enables/disables unsolicited result code for cipher indication. The ciphering indicator feature allows to detect that ciphering is not switched on and to indicate this to the user. The ciphering indicator feature may be disabled by the home network operator setting data in the SIM/USIM. If this feature is not disabled by the SIM/USIM, then whenever a connection is in place, which is unenciphered, or changes from ciphered to unenciphered or vice versa, an unsolicited indication shall be given to the user. The format is:

#CIPHIND: <mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | enable/disable #CIPHIND: unsolicited result code |

Values:

0 : disable

1 : enable

AT#CIPHIND?

Read command reports the <mode>,<cipher> and <SIM/USIM flag>:

#CIPHIND: <mode>,<cipher>,<SIM/USIM flag>

Additional info:

- Here is the list of the parameters meaning returned by the read command.

| Name | Type | Default | Description |
|-----------------|---|---------|-----------------------------------|
| <cipher> | integer | 0 | shows cipher status |
| | Values: | | |
| | 0 : cipher off | | |
| | 1 : cipher on | | |
| | 2 : unknown (missing network information) | | |
| <SIM/USIM flag> | integer | 0 | SIM/USIM cipher status indication |
| | Values: | | |
| | 0 : disabled | | |
| | 1 : enabled | | |
| | 2 : unknown (flag not read yet) | | |

 **AT#CIPHIND=?**

Test command reports the range for the parameter <mode>

3.3.28. AT#PSNT - Packet Service Network Type

The command enables/disables unsolicited result code for packet service network type (PSNT)

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#PSNT=[<mode>]

Set command enables/disables unsolicited result code for packet service network type (PSNT) having the following format:

#PSNT:<nt>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | enables/disables PSNT unsolicited result code. |

Values:

- 0 : disables PSNT unsolicited result code
- 1 : enables PSNT unsolicited result code
- 2 : PSNT unsolicited result code is enabled, and read command returns the message shown in the read section.

Unsolicited field:

| Name | Type | Description |
|------|---------|--------------|
| <nt> | integer | network type |

Values:

- 0 : GPRS network

| | | |
|---|---|---------------------------|
| 1 | : | EGPRS network |
| 4 | : | LTE network |
| 5 | : | unknown or not registered |

AT#PSNT?

If **<mode>** is set to 0 or 1, read command returns the current values of the **<mode>** and **<nt>** parameters in the format:

#PSNT: <mode>,<nt>

If **<mode>** is set to 2, read command returns the current values of **<mode>** and **<nt>** parameters followed by four dummy parameters set to 0.

#PSNT:<mode>,<nt>,0,0,0,0

AT#PSNT=?

Test command reports the range for the parameter **<mode>**

3.3.29. AT#ENCALG - Set Encryption Algorithm

This command enables or disables the GSM and/or GPRS encryption algorithms supported by the module.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ENCALG=[<encGSM>][,<encGPRS>]

Set command enables or disables the GSM and/or GPRS encryption algorithms supported by the module.

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <encGSM> | integer | 5 | <p>The <encGSM> (one byte long) is a bit mask where each bit, when set, indicates the corresponding GSM encryption algorithm</p> <p>19. bit 0 = A5/1 20. bit 1 = A5/2 21. bit 2 = A5/3 22. bits 3 - 7 = reserved for future use</p> |

Values:

0 : no GSM encryption algorithm

1÷7 : sum of integers each representing a specific GSM encryption algorithm: 1 – A5/1 2 – A5/2 4 – A5/3

255 : reset the default values

| | | | |
|-----------|---------|---|---|
| <encGPRS> | integer | 7 | <p>The <encGPRS> (one byte long) is a bit mask where each bit, when set, indicates the corresponding GPRS encryption algorithm</p> <p>23. bit 0 = GEA1</p> |
|-----------|---------|---|---|

-
- 24. **bit 1** = GEA2
 - 25. **bit 2** = GEA3
 - 26. **bits 3 - 7** = reserved for future use

Values:

- 0 : no GPRS encryption algorithm
 - 1÷7 : sum of integers each representing a specific GPRS encryption algorithm: 1 – GEA1 2 – GEA2 4 – GEA3
 - 255 : reset the default values
-

- i** The values are stored in NVM and available on following reboot.
- i** For possible **<encGSM>** and **<encGPRS>** encryptions see test command response.
- i** If no parameter is issued, the set command returns **ERROR**.

AT#ENCALG?

Read command reports the currently selected **<encGSM>** and **<encGPRS>**, and the last used **<usedGSM>** and **<usedGPRS>** in the format:

#ENCALG: <encGSM>,<encGPRS>,<usedGSM>,<usedGPRS>

Additional info:

- ▶▶ Last used **<useGSM>** and **<useGPRS>** are expressed in the format:

| Name | Type | Default | Description |
|------------------------|---------|---------|--------------------------|
| <usedGSM> | integer | 1 | GSM encryption algorithm |

Values:

- 0 : no GSM encryption algorithm
- 1 : A5/1
- 2 : A5/2
- 3 : A5/3
- 255 : not available

<usedGPRS> integer 3 GPRS encryption algorithms

Values:

- 0 : no GPRS encryption algorithm
 - 1,2 : GEA1, GEA2
 - 4 : GEA3
 - 255 : not available
-

AT#ENCALG=?

Test command reports the supported range of values for parameters in the format:

<encGSM> and **<encGPRS>**.

```
AT#ENCALG?  
#ENCALG: 5,2,1,1  
OK
```

```
AT#ENCALG=5,1  
OK
```

Sets the GSM encryption algorithm A5/1 and A5/3, and the GPRS encryption algorithm GEA1. It will be available at the next reboot.

```
AT#ENCALG?  
#ENCALG: 5,2,1,1
```

The last two values indicate that the last used GSM encryption algorithm is A5/1 and the last used GPRS encryption algorithm is GEA1

After reboot

```
AT#ENCALG?  
#ENCALG: 5,1,1,1
```

3.3.30. AT+CEMODE - Set Mode of Operation for EPS

This set command configures the mode of operation for EPS.

[1] 3GPP TS 24.301

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CEMODE=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | N/A | <p>mode of operation. The default value depends on product and the support of VoLTE.</p> <p>Default value is 2 for the variants not supporting VoLTE</p> <p>UE modes of operation can be found in standard [1]. Other values are reserved and will result in an ERROR response to the set command.</p> |

Values:

- 0 : PS mode 2 of operation
- 1 : CS/PS mode 1 of operation
- 2 : CS/PS mode 2 of operation
- 3 : PS mode 1 of operation

AT+CEMODE?

Read command returns the current value of parameter **<mode>** in the format:

+CEMODE: < mode >

-  The read command will return right values after set command, but effectively the mode of operation changes after power cycle.

AT+CEMODE=?

Test command returns the supported range of values of parameters **<mode>**.

 Set EPS mode
AT+CEMODE=1
OK

Check EPS mode
AT+CEMODE?
+CEMODE: 1
OK

3.3.31. AT+CESQ - Extended Signal Quality

Execution command returns received signal quality parameters according to the network on which the module is registered.

- [1] 3GPP TS 27.007
- [2] 3GPP TS 45.008
- [3] 3GPP TS 25.133
- [4] 3GPP TS 36.133

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CESQ

See Additional info section for networks on which the module can be registered.

Additional info:

- ▶▶ The execution command returns the following message. Its format depends on the network on which the module is registered.

2G Networks

+CESQ: <rxlev>,<ber>,255,255,255,255

LTE Networks

+CESQ: 99,99,255,255,<rsrq>,<rsrp>

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <rxlev> | integer | N/A | received signal strength level, see 3GPP TS 45.008 subclause 8.1.4. |

Values:

- 0 : $\text{rssi} < -110 \text{ dBm}$
- 1 : $-110 \text{ dBm} \leq \text{rssi} < -109 \text{ dBm}$
- 2 : $-109 \text{ dBm} \leq \text{rssi} < -108 \text{ dBm}$
- ... : ...
- 61 : $-50 \text{ dBm} \leq \text{rssi} < -49 \text{ dBm}$
- 62 : $-49 \text{ dBm} \leq \text{rssi} < -48 \text{ dBm}$
- 63 : $-48 \text{ dBm} \leq \text{rssi}$
- 99 : not known or not detectable or if the current serving cell is not a GERAN cell

<ber> integer N/A channel bit error rate.

Values:

- 0÷7 : as RXQUAL values, see 3GPP TS 45.008 subclause 8.2.4
- 99 : not known or not detectable or if the current serving cell is not a GERAN cell

<rsrq> integer N/A reference signal received quality, see 3GPP TS 36.133 subclause 9.1.7.

Values:

- 0 : $\text{rsrq} < -19.5 \text{ dB}$
 - 1 : $-19.5 \text{ dB} \leq \text{rsrq} < -19.0 \text{ dB}$
 - 2 : $-19.0 \text{ dB} \leq \text{rsrq} < -18.5 \text{ dB}$
 - ... : ...
 - 32 : $-4 \text{ dB} \leq \text{rsrq} < -3.5 \text{ dB}$
 - 33 : $-3.5 \text{ dB} \leq \text{rsrq} < -3 \text{ dB}$
-

34 : $-3 \text{ dB} \leq \text{rsrq}$

255 : not known or not detectable or if the current serving cell is not a E-UTRA cell

| | | | |
|---------------------|---------|-----|--|
| <rsrp> | integer | N/A | reference signal received power, see 3GPP TS 36.133 subclause 9.1.4. |
|---------------------|---------|-----|--|

Values:

0 : $\text{rsrp} < -140 \text{ dBm}$

1 : $-140 \text{ dBm} \leq \text{rsrp} < -139 \text{ dBm}$

2 : $-139 \text{ dBm} \leq \text{rsrp} < -138 \text{ dBm}$

... : ...

95 : $-46 \text{ dBm} \leq \text{rsrp} < -45 \text{ dBm}$

96 : $-45 \text{ dBm} \leq \text{rsrp} < -44 \text{ dBm}$

97 : $-44 \text{ dBm} \leq \text{rsrp}$

255 : not known or not detectable or if the current serving cell is not a E-UTRA cell

AT+CESQ=?

Test command returns values supported as compound values.

3.3.32. AT#ENS - Enhanced Network Selection

Set command is used to activate the Enhanced Network Selection (ENS) functionality.

Cingular Wireless LLC Requirement

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ENS=[<mode>]

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|--------|---------|---|----------------------------------|
| <mode> | integer | 0 | enable/disable ENS functionality |
|--------|---------|---|----------------------------------|

Values:

0 : disable

1 : enable

Additional info:

- ▶▶ If **AT#ENS=1** has been issued, at every next power-up SIM Application Toolkit will be enabled on user interface 0 if not previously enabled on a different user interface (**AT#STIA=2**).

The new setting will be available at the next power-up.

AT#ENS?

Read command reports whether the ENS functionality is currently enabled or not, in the format:

#ENS: <mode>

AT#ENS=?

Test command reports the available range of values for parameter
<mode>

3.3.33. AT+WS46 - PCCA STD-101 Select Wireless Network

This command selects the cellular network (Wireless Data Service, WDS).

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+WS46=[<n>]

Set command selects the cellular network (Wireless Data Service, WDS) to operate with the **TA** (WDS-Side Stack Selection).

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | N/A | WDS-Side Stack to be used by the TA . |
| | | 27. | 4G/2G products support <n> parameter values 12, 28 and 30. 30 is factory default |
| | | 28. | 4G only products support <n> parameter value 28 |

Values:

- 12 : GSM Digital Cellular Systems, GERAN only
- 28 : E-UTRAN only
- 30 : GERAN and E-UTRAN

i <n> parameter setting is stored in NVM, and available at next reboot.

-
-  For NA (North America) products supporting AT&T requirement 13340 about RAT Balancing and EF-RAT Mode, the value **<n>** stored with **+WS46** command can be changed and overwritten in case of full SIM read, examples: power on; **AT+CFUN=4**, **AT+CFUN=1** sequence; SIM ejection, SIM insertion sequence.
-

AT+WS46?

Read command reports the currently selected cellular network, in the format:

+ WS46: <n>

AT+WS46=?

Test command reports the range for the parameter **<n>**.

3.3.34. AT+CEDRXS - eDRX Setting

This command controls the setting of the UEs eDRX parameters.

3GPP TS 27.007
3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CEDRXS=[<mode>[,<AcTtype>[,<Req_eDRX>]]]

Set command controls the setting of the UEs eDRX parameters. The command controls whether the UE wants to apply eDRX or not, as well as the requested eDRX value for each specified type of access technology.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | disable or enable the use of eDRX in the UE. This parameter is applicable to all specified types of access technology, i.e. the most recent setting of <mode> will take effect for all specified values of <AcTtype>. |

Values:

- 0 : disable the use of eDRX
- 1 : enable the use of eDRX
- 2 : enable the use of eDRX and enable the unsolicited result code, see Additional info.
- 3 : disable the use of eDRX and discard all parameters for eDRX or, if available, reset to the manufacturer specific default values

<AcTtype> integer N/A type of access technology.

Values:

- 0 : Access technology is not using eDRX. This parameter value is only used in the unsolicited result code, it cannot be used in the set command.
 - 2 : GSM (A/Gb mode)
 - 4 : E-UTRAN (CAT M1 mode)
 - 5 : E-UTRAN (NB1 mode)
-

<Req_eDRX> string - half a byte in a 4-bit format. The eDRX value refers to bit 4 to 1 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see Extended DRX parameters information element in 3GPP TS 24.008, Table 10.5.5.32/3GPP TS 24.008. Default value is "0000".

Additional info:

- ▶▶ If **<mode>=2** and there is a change in the eDRX parameters provided by the network, the unsolicited result code reports:

+CEDRXS:

<AcTtype>[,<Req_eDRX>[,<NW_prove_DRX>[,<PagTimeWindow>]]]

| Name | Type | Default | Description |
|-----------------------------|--------|---------|--|
| <NW_prove_DRX> | string | - | half a byte in a 4-bit format. The eDRX value refers to bit 4 to 1 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of |

| | | | |
|-----------------|--------|---|---|
| | | | 3GPP TS 24.008). For the coding and the value range, see Extended DRX parameters information element in 3GPP TS 24.008 Table 10.5.5.32/3GPP TS 24.008. |
| <PagTimeWindow> | string | - | half a byte in a 4-bit format. The paging time window refers to bit 8 to 5 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see the Extended DRX parameters information element in 3GPP TS 24.008 Table 10.5.5.32/3GPP TS 24.008. |

AT+CEDRXS?

Read command returns the current settings for each defined value of <AcTtype>, in format:

```
+CEDRXS: <AcTtype>,<Req_eDRX>[<CR><LF>
+CEDRXS: <AcTtype>,<Req_eDRX>[...]]
```

AT+CEDRXS=?

Test command returns the supported <mode>s and the value ranges for the access technology and the requested eDRX value as compound values.

```
AT+CEDRXS?  
+CEDRXS: 4,"0000"  
+CEDRXS: 5,"0000"  
OK
```

3.3.35. AT+CEDRXRDP - eDRX Read Dynamic Parameters

This command returns a message related to Extended Discontinuous Reception (eDRX).

3GPP TS 27.007
3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CEDRXRDP

Execution command returns the following message if eDRX is used for the cell that the MS is currently registered to, in the format:

+CEDRXP:<AcTtype>[,<Req_eDRX>[,<NW_prov_eDRX>[,<PagTimeWindow>]]]

If the cell that the MS is currently registered to is not using eDRX, **<AcTtype>=0** is returned.

Additional info:

- ▶▶ Here is the list of the meanings of the parameter returned by the **+CEDRXRDP** command.

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|------------------------|---------|---|----------------------------|
| <AcTtype> | integer | 0 | type of access technology. |
|------------------------|---------|---|----------------------------|

Values:

0 : access technology is not using eDRX

2 : see +CEDRXS.

4 : see +CEDRXS.

5 : see +CEDRXS.

| | | | |
|-----------------|--------|---|--------------|
| <Req_eDRX> | string | - | see +CEDRXS. |
| <NW_prov_eDRX> | string | - | see +CEDRXS. |
| <PagTimeWindow> | string | - | see +CEDRXS. |

? AT+CEDRXRDP=?

Test command returns **OK** result code.

3.3.36. AT+CEREG - EPS Network Registration Status

This command monitors the Evolved Packet System (EPS) network registration status in LTE.

- [1] 3GPP TS 24.008
- [2] 3GPP TS 24.301
- [3] 3GPP TS 25.331

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CEREG=[<mode>]

Set command enables/disables the EPS network registration unsolicited result code (URC) in LTE, and selects one of the available formats:

short format: **+CEREG: <stat>**

long format: **+CEREG: <stat>[, [<tac>], [<ci>], [<AcT>]]**

<tac>, **<ci>**, and **<AcT>** are reported by the command only if available.

In case of error, possible response(s): **+CME ERROR: <err>**

Parameter:

| Name | Type | Default | Description |
|---------------------|---------|---------|---|
| <mode> | integer | 0 | enables/disables the network registration unsolicited result code (URC), and selects one of the available formats. The following events triggers the URC: 29. URC short format is displayed every time there is a change in the EPS network registration status |

30. URC long format is displayed every time there is a change of network cell in LTE

Values:

- 0 : disable the network registration unsolicited result code
- 1 : enable the network registration unsolicited result code, and select the short format
- 2 : enable the network registration unsolicited result code, and selects the long format (includes the network cell identification data)

Unsolicited fields:

| Name | Type | Description |
|------|------|-------------|
|------|------|-------------|

| | | |
|--------|---------|-------------------------|
| <stat> | integer | EPS registration status |
|--------|---------|-------------------------|

Values:

- 0 : not registered, terminal is not currently searching a new operator to register to
- 1 : registered, home network
- 2 : not registered, but terminal is currently searching a new operator to register to
- 3 : registration denied
- 4 : unknown. Example, out of LTE coverage
- 5 : registered, roaming
- 6 : registered for "SMS only", home network (not applicable)
- 7 : registered for "SMS only", roaming (not applicable).
- 8 : attached for emergency bearer services only. 3GPP TS 24.008 [8] and 3GPP TS 24.301 [83]

specify the condition when the MS is considered as attached for emergency bearer services.

9 : registered for "CSFB not preferred", home network (not applicable).

10 : registered for "CSFB not preferred", roaming (not applicable).

| | | |
|--------------------|--------|--|
| <tac> | string | tracking area code (two bytes) in hexadecimal format (e.g. "00C3" equals 195 in decimal) |
|--------------------|--------|--|

| | | |
|-------------------|--------|--|
| <ci> | string | LTE cell ID (four bytes) in hexadecimal format |
|-------------------|--------|--|

| | | |
|--------------------|---------|--|
| <AcT> | integer | indicates the access technology of the serving cell. |
|--------------------|---------|--|

Values:

0 : GSM

8 : CAT M1

9 : NB IoT

AT+CEREG?

Read command returns the current value of **<mode>**, the registration status **<stat>**, and the information **<tac>**, **<ci>**, **<AcT>** according to the current **<mode>** parameter value.

+CEREG: <mode>,<stat>,[,<tac>],[,<ci>],[,<AcT>]]

AT+CEREG=?

Test command returns supported values for parameter **<mode>**.

3.3.37. AT#CPSMSCFG - PSM State Configuration

This command configures PSM state

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#CPSMSCFG=<psm_inactivity_timeout>[,<psm_duration_due_to_inactivity>]**

Set command selects PSM inactivity timeout and PSM duration due to inactivity

Parameters:

| Name | Type | Default | Description |
|----------------------------------|---------|---|---|
| <psm_inactivity_timeout> | integer | 0 | PSM inactivity timeout in seconds |
| Values: | | | |
| 0 | : | disabled | |
| 10÷120 | : | PSM inactivity timeout in seconds | |
| <psm_duration_due_to_inactivity> | integer | 0 | PSM duration due to inactivity in seconds |
| Values: | | | |
| 0 | : | disabled | |
| 120÷7200 | : | PSM duration due to inactivity in seconds | |

 **AT#CPSMSCFG?**

Read command reports the current value of parameters
<psm_inactivity_timeout> and <psm_duration_due_to_inactivity>.

?  **AT#CPSMSCFG=?**

Test command returns the range of values for parameters
<psm_inactivity_timeout> and <psm_duration_due_to_inactivity>.

3.3.38. AT#RFSTS - Read Current Network Status

Command reads current network status.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#RFSTS

Execution command returns the current network status. The format of the returned message is according to the network on which the module is registered.

GSM network

#RFSTS:<PLMN>,<ARFCN>,<RSSI>,<LAC>,<RAC>,<TXPWR>,<MM>,<RR>,<NOM>,<CID>,<IMSI>,<NetNameAsc>,<SD>,<ABND>

| Parameters | Description |

| <T3402> | Timer T3402 in seconds |
| <T3412> | Timer T3412 in seconds |
| <SINR> | Signal-to-Interface plus Noise Ratio |

? AT#RFSTS=?

Test command tests for command existence.

3.3.39. AT#SPN - Read SIM Field SPN

This command reads SIM fields SPN.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SPN

Execution command returns the service provider string contained in the SIM field SPN, in the format:

#SPN: <spn>

Unsolicited field:

| Name | Type | Description |
|-------|--------|---|
| <spn> | string | service provider string contained in the SIM field SPN, represented in the currently selected character set, see +CSCS . |

- i** If the SIM field SPN is empty, the command returns the **OK** result code.

AT#SPN=?

Test command returns the **OK** result code.

3.3.40. AT#CEDRXS - Extended eDRX Setting

This command controls the setting of the UEs eDRX parameters.

3GPP TS 27.007

3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#CEDRXS=[<mode>[,<AcTtype>[,<Req_eDRX>[,<ReqPagTimeWindow>]]]]**

Set command controls the setting of the UEs eDRX parameters. The command controls whether the UE wants to apply eDRX or not, as well as the requested eDRX value for each specified type of access technology.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | disable or enable the use of eDRX in the UE. This parameter is applicable to all specified types of access technology, i.e. the most recent setting of <mode> will take effect for all specified values of <AcT>. |

Values:

- 0 : disable the use of eDRX
- 1 : enable the use of eDRX
- 2 : enable the use of eDRX and enable the unsolicited result code, see Additional info.

- 3 : disable the use of eDRX and discard all parameters for eDRX or, if available, reset to the manufacturer specific default values

| | | | |
|--|---------|-----|--|
| <AcTtype> | integer | N/A | type of access technology. |
| Values: | | | |
| 0 : Access technology is not using eDRX. This parameter value is only used in the unsolicited result code, it cannot be used in the set command. | | | |
| 2 : GSM (A/Gb mode) | | | |
| 4 : E-UTRAN (CAT M1 mode) | | | |
| 5 : E-UTRAN (NB1 mode) | | | |
| <Req_eDRX> | string | - | half a byte in a 4 bit format. The eDRX value refers to bit-4 to 1 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see Extended DRX parameters information element in 3GPP TS 24.008, Table 10.5.5.32/3GPP TS 24.008. Default value is "0000" |
| <ReqPagTimeWindow> | string | - | half a byte in a 4-bit format. The paging time window refers to bit 8 to 5 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see the Extended DRX parameters information |

element in 3GPP TS 24.008
Table 10.5.5.32/3GPP TS
24.008. Default value is
"0000"

Additional info:

- ▶▶ If `<mode>=2` and there is a change in the eDRX parameters provided by the network, the unsolicited result code reports:

```
#CEDRXP:<AcTtype>[,<Req_eDRX>[,<NW_prov_eDRX>[,<ReqPagTimeWindow>
[,<NW_prov_PagTimeWindow>]]]]
```

| Name | Type | Default | Description |
|--|--------|---------|---|
| <code><NW_prov_eDRX></code> | string | - | half a byte in a 4-bit format. The eDRX value refers to bit 4 to 1 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see Extended DRX parameters information element in 3GPP TS 24.008 Table 10.5.5.32/3GPP TS 24.008. |
| <code><NW_prov_PagTimeWindow></code> | string | - | half a byte in a 4-bit format. The paging time window refers to bit 8 to 5 of octet 3 of the Extended DRX parameters information element (see subclause 10.5.5.32 of 3GPP TS 24.008). For the coding and the value range, see the Extended DRX parameters information element in |

← AT#CEDRXS?

Read command returns the current settings for each defined value of **<AcTtype>** in the format:

```
#CEDRXS:<AcTtype>,<eDRX_act_state>,<Req_eDRX>,<ReqPagTimeWindow>,<mode>[<CR><LF>
```

```
#CEDRXS:<AcTtype>,<eDRX_act_state>,<Req_eDRX>,<ReqPagTimeWindow>,<mode>[...]]]
```

If **<AcTtype>** is the same the device is registered to, the format is

```
#CEDRXS:<AcTtype>,<eDRX_act_state>,<Req_eDRX>,<ReqPagTimeWindow>,<eDRX_nw_state>,<NW_prov_eDRX>,<NW_prov_PagTimeWindow>,<mode>
```

Additional info:

- ▶▶ Meaning of the **<eDRX_act_state>** parameter.

| Name | Type | Default | Description |
|-------------------------------|---------|---------|-------------|
| <eDRX_act_state> | integer | 0 | eDRX status |

Values:

0 : eDRX disabled

1 : eDRX enabled

- ▶▶ Meaning of the **<eDRX_nw_state>** parameter.

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|------------------------------|---------|---|----------------------------|
| <eDRX_nw_state> | integer | 0 | eDRX status in the network |
|------------------------------|---------|---|----------------------------|

Values:

0 : eDRX disabled

1 : eDRX enabled

AT#CEDRXS=?

Test command returns the supported **<mode>**s and the value ranges for the access technology, requested eDRX value and requested Paging Time Window as compound values.

```
</> AT#CEDRXS?  
#CEDRXS: 2,0,"0000","0000"  
#CEDRXS: 4,0,"0000","0000"  
#CEDRXS: 5,0,"0000","0000"  
OK
```

3.3.41. AT#MONI - Cell Monitor

This command is both a set and an execution command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MONI[=[<number>]]

Set command sets one cell out of seven, in a neighbor list of the serving cell including it, from which extract GSM/LTE related information.

After entering the set command, enter the execution command **AT#MONI**<CR> to get the GSM/LTE related information for the selected cell and dedicated channel (if exists) in the format shown, for each network, in the Additional info section.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <number> | integer | - | the parameter meaning depends on the network, see Additional info section. |

Additional info:

▶▶ GSM network

| Name | Type | Default | Description |
|----------|---------|---------|-------------|
| <number> | integer | 0 | GSM network |

Values:

0÷6 : it is the ordinal number of the cell, in the neighbor list of the serving cell.

- 7 : it is a special request to obtain GSM-related information from the whole set of seven cells in the neighbor list of the serving cell

▶▶ LTE network

| Name | Type | Default | Description |
|----------|---------|---------|-------------|
| <number> | integer | 0 | LTE network |

Values:

- 0 : it is the serving cell
- 1 : it is the intra-frequency cells
- 2 : it is the inter-frequency cells
- 3 : it is the W-CDMA neighbor cells, the report message is empty.
- 4 : it is the GSM neighbor cells
- 5,6 : it is not available
- 7 : it is a special request to obtain LTE-related information from the all available neighbor cells.

- ▶▶ Execution command **AT#MONI**<CR> reports GSM/LTE related information for selected cell and dedicated channel (if exists) in the following formats:

a) When extracting data for the serving cell and the network name is known the format is:

GSM network

**#MONI: <netname> BSIC:<bsic> RxQual:<qual> LAC:<lac> Id:<id>
ARFCN:<arfcn> PWR:<dBm> dBm TA: <timadv>**

LTE network

**#MONI: <netname> RSRP:<rsrp> RSRQ:<rsrq> TAC:<tac> Id:<id>
EARFCN:<earfcn> PWR:<dBm> DRX:<drx> pci:<physicalCellId>
QRxLevMin:<QRxLevMin> TA: <timadv>**

b) When the network name is unknown, the format is:

GSM network

**#MONI: <cc> <nc> BSIC:<bsic> RxQual:<qual> LAC:<lac> Id:<id>
ARFCN:<arfcn> PWR:<dBm> dBm TA: <timadv>**

LTE network

**#MONI: Cc:<cc> Nc:<nc> RSRP:<rsrp> RSRQ:<rsrq> TAC:<tac>
Id:<id> EARFCN:<earfcn> PWR:<dBm> DRX:<drx>
pci:<physicalCellId> QRxLevMin:<QRxLevMin> TA: <timadv>**

c) When extracting data for an adjacent cell, the format is:

GSM network

**#MONI: Adj Cell<n> [LAC:<lac> Id:<id>] ARFCN:<arfcn>
PWR:<dBm>**

LTE network

LTE intra-frequency and inter-frequency cells

**#MONI: RSRP:<rsrp> RSRQ:<rsrq> PhysCellId:<physicalCellId>
EARFCN:<earfcn> PWR:<dBm>**

LTE GSM neighbor cells

#MONI: Adj Cell<n> BSIC:<bsic> ARFCN:<arfcn> PWR:<dBm>

| Name | Type | Default | Description |
|------------------|---------|---------|---------------------------------------|
| <netname> | string | - | name of network operator |
| <cc> | string | - | country code |
| <nc> | string | - | network operator code |
| <n> | integer | - | progressive number of adjacent cell |
| <bsic> | string | - | base station identification code |
| <qual> | integer | - | quality of reception: 0..7 |
| <lac> | string | - | localization area code |
| <id> | integer | - | cell identifier |
| <arfcn> | integer | - | assigned radio channel |
| <dBm> | integer | - | received signal strength in dBm. |
| <timadv> | integer | - | timing advance |
| <rscp> | integer | - | Received Signal Code Power in dBm. |
| <drx> | string | - | Discontinuous reception cycle length |
| <physicalCellId> | integer | - | physical cell identifier |
| <rsrp> | integer | - | Reference Signal Received Power |
| <rsrq> | integer | - | Reference Signal Received Quality |
| <tac> | integer | - | Tracking Area Code |
| <earfcn> | integer | - | E-UTRA Assigned Radio Channel |
| <QRxLevMin> | integer | - | minimum required RX level in the cell |

- i** TA: `<timadv>` reported only for the serving cell.
- i** When `AT#MONI=7` is the last setting entered, the execution command `AT#MONI<CR>` reports the information previously listed for each of the cells in the neighbor of the serving cell. The information is formatting in a sequence of `<CR><LF>`-terminated strings.
- i** The timing advance value is meaningful only during calls or GPRS/LTE transfers active.

`AT#MONI=?`

Test command reports the maximum number of cells, in a neighbor of the serving cell excluding it, from which we can extract GSM/LTE related information, along with the ordinal number of the current selected cell, in the format:

`#MONI: {<MaxCellNo>,<CellSet>}`

Additional info:

- ▶▶ Parameters meaning.

| Name | Type | Default | Description |
|--------------------------------|---------|---------|---|
| <code><MaxCellNo></code> | integer | - | maximum number of cells in a neighbor of the serving cell and excluding it from which we can extract GSM/LTE related information. This value is always 6 . |
| <code><CellSet></code> | integer | - | last setting done with command <code>#MONI</code> . |

The module supports GSM network

3.3.42. AT#LTFN - LTE Frame Information

The command returns system frame number and subframe number of LTE network.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#LTFN?

Read command returns system frame number **<sysfn>** and subframe number **<subfn>** of LTE network in the following format:

#LTFN: < sysfn >, < subfn >

Additional info:

- ▶▶ Here are the parameters meanings.

| Name | Type | Default | Description |
|----------------------|---------|---------|---------------------|
| <sysfn> | integer | - | system frame number |
| <subfn> | string | - | subframe number. |

-  If module is not registered in LTE network, the command returns **ERROR**.

AT#LTFN=?

Test command returns **OK** result code.

3.3.43. AT+CRCES - Reading Coverage Enhancement Status

This execution command returns the coverage enhancement status of the MT. The terminal can consider the coverage enhancement status prior to deciding to transmit. Depending on the coverage enhancement status the terminal can refrain from transmitting data.

The coverage enhancement status is only provided by the MT if the access technology of the serving cell is CAT M1 or NB-IoT. If the access technology of the serving cell is different, **<Act>=0** is indicated.

[1] 3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CRCES

Additional info:

- ▶▶ The execution command returns the following message.

+CRCES: <AcT>,<CE_level>,<CC>

| Name | Type | Default | Description |
|--------------------|---------|---------|---------------------------------------|
| <AcT> | integer | N/A | access technology of the serving cell |

Values:

- 0 : Serving cell has no coverage enhancement
- 1 : CAT M1
- 3 : NB-IoT

| | | | |
|-------------------------|---------|-----|--|
| <CE_level> | integer | N/A | Coverage Enhancement (CE) level of the MT in the serving cell. |
|-------------------------|---------|-----|--|

Values:

0 : No Coverage Enhancement in the serving cell

1 : Coverage Enhancement level 0

2 : Coverage Enhancement level 1

3 : Coverage Enhancement level 2

4 : Coverage Enhancement level 3

| | | | |
|-------------------|---------|-----|---|
| <CC> | integer | N/A | Coverage Class (CC) of the MT in the serving cell. Currently not supported. |
|-------------------|---------|-----|---|

Value:

0 : No Coverage Class in the serving cell

AT+CRCES=?

Test command returns **OK** result code.

3.3.44. AT#SNRSET - SNR Set Level

Set command manages EFS file SNR_level_scan_scope.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SNRSET=[<level>]

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <level> | integer | 2 | sets the SNR level to be used in scanning networks |

Value:

1÷3 : levels

AT#SNRSET?

Read command reports the current value for <level>, in the format:

#SNRSET: <level>

AT#SNRSET=?

Test command reports the range for the parameter <level>.

3.3.45. AT#IOTBND - CAT-M1 & NB-IoT Band Setting

Set command configures the CAT-M1 and NB-IoT bands.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

➡ `AT#IOTBND=[<lte_m1_band_pref.bits_1_64>][,<lte_m1_band_pref.bits_65_128>][,<lte_nb1_band_pref.bits_1_64>,<lte_nb1_band_pref.bits_65_128>]]`

Parameters:

| Name | Type | Default | Description |
|--------------------------------|---------|---------|--|
| <lte_m1_band_pref.bits_1_64> | integer | - | indicates the lower (1-64) CAT-M1 supported bands, expressed as the sum of Band number (0 meaning "no low band selected"); see #BND command |
| <lte_m1_band_pref.bits_65_128> | integer | - | indicates the higher (65-128) CAT-M1 supported bands, expressed as the sum of Band number (0 meaning "no high band selected"); see #BND command |
| <lte_nb1_band_pref.bits_1_64> | integer | - | indicates the lower (1-64) NB-IoT supported bands, expressed |

| | | | |
|--|---------|---|--|
| | | | as the sum of Band number (0 meaning "no low band selected"); see #BND command |
| <code><lte_nb1_band_pref.bits_65_128></code> | integer | - | indicates the higher (65-128) NB-IoT supported bands, expressed as the sum of Band number (0 meaning "no high band selected"); see #BND command |

 The command needs a reboot to be effective.

AT#IOTBND?

Read command returns the current parameters setting for **#IOTBND** command in the format:

#IOTBND:

`<lte_m1_band_pref.bits_1_64>,<lte_m1_band_pref.bits_65_128>,<lte_nb1_band_pref.bits_1_64>,<lte_nb1_band_pref.bits_65_128>`

AT#IOTBND=?

Test command reports the supported range of values for parameters:

`<lte_m1_band_pref.bits_1_64>,<lte_m1_band_pref.bits_65_128>,<lte_nb1_band_pref.bits_1_64>,<lte_nb1_band_pref.bits_65_128>`

3.3.46. AT#IRATTIMER - Inter RAT Timer Setting

Set command configures the IRAT timer and search alignment timer in dedicated EFS file

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#IRATTIMER=<irat_timer>,<search_alignment>

Parameters:

| Name | Type | Default | Description |
|--------------------|---------|---------|---|
| <irat_timer> | integer | - | <p>IRAT timer to move to higher priority RAT for CloT device in minutes. If the device camps on the non-preferred system, it performs periodic searches for the priority system in the foreground.</p> <p>Foreground PLMN search: NAS runs a dedicated timer to search for a more preferable RAT. Once the timer expires, NAS reads the dedicated EFS to establish if the UE is camped on a less preferred system. If so, a service request is sent to search the relevant RAT.</p> <p>Default value is usually 60, but it could vary based on single operator request. You should check using read command.</p> |
| <search_alignment> | integer | 20 | timer in minutes to specify if the modem can proceed with the BPLMN search or not. |

Value:

20 : timer of 20 minutes

 The command needs a reboot to be effective.

AT#IRATTIMER?

Read command returns the current parameters setting for **#IRATTIMER** command in the format:

#IRATTIMER: <irat_timer>,<search_alignment>

AT#IRATTIMER=?

Test command returns the supported range of values for **<irat_timer>** and **<search_alignment>**.

3.3.47. AT#NB2ENA - Enable/Disable NB2 mode

This execution command enables/disables NB2 mode. It is only applicable to products supporting NB-IoT technology.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#NB2ENA=<ena>

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|-------------------------|
| <ena> | integer | 0 | Enable/Disable NB2 mode |

Values:

0 : Disable

1 : Enable

AT#NB2ENA?

Read command reports the current NB2 enabling status in the format:

#NB2ENA: <ena>

AT#NB2ENA=?

Test command returns the current range of values for parameter <ena>.

3.3.48. AT+CLIP - Calling Line Identification Presentation

This command refers to the supplementary service CLIP (Calling Line Identification Presentation) that enables a called subscriber to get the calling line identity (CLI) of the calling party when receiving a mobile terminated call.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CLIP=[<enable>]

Set command enables/disables the presentation of the CLI (Calling Line Identity).

If enabled the device reports after each **RING** the response:

+CLIP: <number>,<type>,"",128,<alpha>,<CLI_validity>

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|-------------|
| <enable> | integer | 0 | enable flag |

Values:

0 : disables CLI indication

1 : enables CLI indication

Unsolicited fields:

| Name | Type | Description |
|----------|---------|--|
| <number> | string | phone number of format specified by <type> |
| <type> | integer | type of address octet |

Values:

-
- 128 : both the type of number and the numbering plan are unknown
 - 129 : unknown type of number and ISDN/Telephony numbering plan
 - 145 : international type of number and ISDN/Telephony numbering plan (contains the character "+")
-

| | | |
|----------------------|--------|---|
| <alpha> | string | alphanumeric representation of <number> corresponding to the entry found in phonebook; used character set should be the one selected with command +CSCS |
|----------------------|--------|---|

| | | |
|-----------------------------|---------|------------------|
| <CLI_validity> | integer | validity of CLIP |
|-----------------------------|---------|------------------|

Values:

- 0 : CLI valid
 - 1 : CLI has been withheld by the originator
 - 2 : CLI is not available due to interworking problems or limitation or originating network
-

- i** In the **+CLIP:** response they are currently not reported either the *subaddress* information (it's always "" after the 2nd comma) and the *subaddress type* information (it's always 128 after the 3rd comma)
 - i** The command changes only the report behavior of the device, it does not change CLI supplementary service setting on the network.
-

AT+CLIP?

Read command returns the presentation status of the CLI in the format:

+CLIP: <enable>,<m>

Additional info:

►► Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--|
| <enable> | integer | N/A | status of the local setting |
| Values: | | | |
| 0 : CLI presentation disabled | | | |
| 1 : CLI presentation enabled | | | |
| <m> | integer | N/A | status of the CLIP service on the GSM network. |
| Values: | | | |
| 0 : CLIP not provisioned | | | |
| 1 : CLIP provisioned | | | |
| 2 : unknown (e.g. no network is present) | | | |

- i** This command issues a status request to the network, hence it may take a few seconds to give the answer due to the time needed to exchange data with it.

?  AT+CLIP=?

Test command returns the supported values of parameter **<enable>**

| Modules Supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.3.49. AT#WS46 - Select IoT Technology

This command selects the IoT technology.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#WS46=[<n>[,<GSM_P>]]

Set command selects the IoT technology to operate with.

Parameters:

| Name | Type | Default | Description |
|------|---------|---------|---|
| <n> | integer | - | selects the technology to be used. The default value depends on the LTE technology supported by the module |

| LTE technology supported | <n> value |
|-------------------------------|-----------|
| CAT-M1 | 0 |
| NB-IoT | 1 |
| CAT-M1 (preferred) and NB-IoT | 2 |
| CAT-M1 and NB-IoT (preferred) | 3 |

| | | | |
|---------|---------|---|---|
| <GSM_P> | integer | 0 | selects the technology priority. In case of both 2G (GSM) and 4G (LTE) networks present selects priority between 2G and 4G. |
|---------|---------|---|---|

Values:

0 : 4G (LTE) priority

1 : 2G (GSM) priority

 The command takes effect after the module reboot.

 **Warning:** the "Not required" information contained in the "SIM Presence" field of the table, placed above the command syntax, must be replaced with "Required".

AT#WS46?

Read command reports the currently selected technology and priority, in the format:

#WS46: <n>,<GSM_P>

AT#WS46=?

Test command reports the range for the parameters <n> and <GSM_P>.

3.4. SIM

3.4.1. AT+CPIN - Enter the PIN

The command sends to the device a password which is necessary before it can be operated.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT+CPIN=<pin>[,<newpin>]

Set command sends to the device a password which is necessary before it can be operated (SIM PIN, SIM PUK, PH-SIM PIN, etc.).

If the PIN required is SIM PUK or SIM PUK2, the <newpin> is required.

This <newpin>, will replace the old pin in the SIM.

The command may be used to change the SIM PIN by sending it with both parameters <pin> and <newpin>.

Parameters:

| Name | Type | Default | Description |
|----------|--------|---------|--|
| <pin> | string | - | PIN required or old PIN if the command is used to change the SIM PIN |
| <newpin> | string | - | new PIN that will replace old pin |

AT+CPIN?

Read command reports the PIN/PUK/PUK2 request status of the device in the form:

+CPIN: <code>

Additional info:

▶▶ Parameters:

| Name | Type | Default | Description |
|--------|--------|---------|----------------------------------|
| <code> | string | N/A | PIN/PUK/PUK2 request status code |

Values:

| | | |
|-------------|---|---|
| READY | : | ME is not pending for any password |
| SIM PIN | : | ME is waiting SIM PIN to be given |
| SIM PUK | : | ME is waiting SIM PUK to be given |
| PH-SIM PIN | : | ME is waiting phone-to-SIM card password to be given |
| PH-FSIM PIN | : | ME is waiting phone-to-very first SIM card password to be given |
| PH-FSIM PUK | : | ME is waiting phone-to-very first SIM card unblocking password to be given |
| SIM PIN2 | : | ME is waiting SIM PIN2 to be given; this <code> is returned only when the last executed command resulted in PIN2 authentication failure (i.e. +CME ERROR: 17) |
| SIM PUK2 | : | ME is waiting SIM PUK2 to be given; this <code> is returned only when the last executed command resulted in PUK2 |

| | |
|---------------|--|
| | authentication failure (i.e. +CME ERROR: 18) |
| PH-NET PIN | : ME is waiting network personalization password to be given |
| PH-NET PUK | : ME is waiting network personalization unblocking password to be given |
| PH-NETSUB PIN | : ME is waiting network subset personalization password to be given |
| PH-NETSUB PUK | : ME is waiting network subset personalization unblocking password to be given |
| PH-SP PIN | : ME is waiting service provider personalization password to be given |
| PH-SP PUK | : ME is waiting service provider personalization unblocking password to be given |
| PH-CORP PIN | : ME is waiting corporate personalization password to be given |
| PH-CORP PUK | : ME is waiting corporate personalization unblocking password to be given |

- i** Pin pending status at startup depends on PIN facility setting; to change or query the default power up setting use the command **AT+CLCK**.

 **AT+CPIN=?**

Test command returns **OK** result code.

 **AT+CMEE=1**
OK

```
AT+CPIN?  
+CME ERROR: 10  
error: you have to insert the SIM
```

```
AT+CPIN?  
+CPIN: READY  
OK  
you inserted the SIM and module is not waiting for PIN
```

3.4.2. AT#PCT - Display PIN Counter

This command reports the PIN/PUK or PIN2/PUK2 input remaining attempts, if **+CPIN** password is required.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#PCT

Execution command reports the PIN/PUK or PIN2/PUK2 input remaining attempts, depending on **+CPIN** requested password, in the format:

#PCT: <n>

Additional info:

- ▶▶ Here is shown the parameter meaning.

| Name | Type | Default | Description |
|------|---------|---------|---------------------|
| <n> | integer | N/A | remaining attempts. |

Values:

- 0 : the SIM is blocked
- 1÷3 : if the device is waiting either SIM PIN or SIM PIN2 to be given.
- 1÷10 : if the device is waiting either SIM PUK or SIM PUK2 to be given.

AT#PCT=?

Test command returns the **OK** result code.

```
AT+CPIN?  
+CPIN: SIM PIN  
OK
```

```
AT#PCT Check PIN remained counter  
#PCT: 3  
OK
```

```
AT+CPIN=1111 Input incorrect PIN number  
+CME ERROR: incorrect password
```

```
AT#PCT  
#PCT: 2  
OK
```

3.4.3. AT+CCID - Read ICCID

Execution command reads on SIM the Integrated Circuit Card Identification (ICCID). It is the card identification number that provides a unique identification number for the SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT+CCID

The command returns the following message:

```
+CCID: <ICCID>
OK
```

AT+CCID?

Read command returns the following message:

```
+CCID: <ICCID>
OK
```

AT+CCID=?

Test command returns the **OK** result code.

```
AT+CCID
+CCID: 89861109091740011006
OK
```

3.4.4. AT+CIMI - International Mobile Subscriber Identity (IMSI)

This command returns the International Mobile Subscriber Identity (IMSI number).

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CIMI

Execution command returns the value of the International Mobile Subscriber Identity stored in the SIM, the returned message has the following format (with command no echoed):

```
<IMSI value>
OK
```

-  If the SIM is not inserted, the command returns **ERROR**.

AT+CIMI=?

Test command returns **OK** result code

```
AT+CIMI
22201701202507
OK
```

3.4.5. AT#CIMI - International Mobile Subscriber Identity (IMSI)

This command returns the International Mobile Subscriber Identity (IMSI number).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CIMI

Execution command returns the value of the International Mobile Subscriber Identity stored in the SIM, the returned message has the following format (with command echoed):

```
#CIMI: <IMSI value>  
OK
```

-  If the SIM is not inserted, the command returns **ERROR**.

AT#CIMI=?

Test command returns the **OK** result code.

```
AT#CIMI  
#CIMI: 450050209516643  
OK
```

3.4.6. AT#SIMDET - SIM Detection Mode

The command manages the SIM Detection mode.

[1] Telit Hardware Design Guide of the used module.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT#SIMDET=<mode>

Set command simulates the SIM status or selects the automatic SIM Detection status. This command is used: by modules providing the SIMIN pin, dedicated or set through **#SIMINCFG** command; by modules without SIMIN pin, forcing SIM presence or absence.

Refer to document [1] to have information on dedicated SIMIN pin.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 2 | the <mode> parameter can be used as shown in Values section. |

Values:

- 0 : ignores dedicated SIMIN pin, and simulate the status "SIM Not Inserted"
- 1 : ignores dedicated SIMIN pin, and simulate the status "SIM Inserted"
- 2 : selects automatic SIM detection using dedicated SIMIN Pin

- i** When **#SIMDET=1** (that simulates "SIM Inserted") is issued, a query to detect the presence of the SIM is forced, regardless of SIMIN pin status. If SIM is correctly answering to queries then SIM status becomes SIM READY
- i** For ME310G1 family, default value of **<mode>** parameter is 1
- i** If the SIMIN pin is not connected to the SIM holder, do not use **#SIMDET=2**

AT#SIMDET?

Read command returns the currently selected Sim Detection Mode in the format:

#SIMDET: <mode>,<simIn>

Additional info:

- ▶▶ The values for **<simIn>** are:

| Name | Type | Default | Description |
|----------------------|---------|---------|-------------------|
| <simIn> | integer | 0 | SIMIN pin status. |

Values:

0 : SIM not inserted

1 : SIM inserted

- i** The **<simIn>** parameter is meaningless in absence of the SIMIN pin.

AT#SIMDET=?

Test command reports the supported range of values for parameter **<mode>**.

3.4.7. AT#SIMPR - SIM Presence Status

The command enables/disables the SIM Presence Status unsolicited indication.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT#SIMPR=[<mode>]

Set command enables/disables the SIM Presence Status unsolicited indication in the ME. This command reports also the status of the remote SIM, if the SIM Access Profile (SAP) functionality is supported and has been enabled.

If notification is enabled, the ME informs about every (local and remote) SIM status change through the following URC:

#SIMPR: <SIM>,<status>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | Specifies if notification must be enabled or disabled. |

Values:

0 : notification disabled

1 : notification enabled

Unsolicited fields:

| Name | Type | Description |
|-------|---------|-----------------------------|
| <SIM> | integer | Reports local or remote SIM |
| | | Values: |
| | 0 | : local SIM |

| | | | | |
|-----------------------|---------|----------------------------|---|------------------|
| | | 1 | : | remote SIM |
| <status> | integer | Reports current SIM status | | |
| | | Values: | | |
| | | 0 | : | SIM not inserted |
| | | 1 | : | SIM inserted |

- i** **<status>** parameter is meaningless for local SIM in absence of the SIMIN pin, see **#SIMDET** command.
- i** Entering **AT#SIMPR=** returns **OK** but has no effect.

AT#SIMPR?

Read command reports whether the unsolicited indication **#SIMPR:** is currently enabled or not, along with the local and remote SIM status, in the format:

#SIMPR: <mode>,<SIM>,<status><CR><LF>

#SIMPR: <mode>,<SIM>,<status>

- i** If SAP functionality is not supported or enabled the remote SIM status will always be 0

? AT#SIMPR=?

Test command reports the range for the parameter **<mode>**

3.4.8. AT#CCID - Read ICCID

Execution command reads on SIM the Integrated Circuit Card Identification (ICCID). It is the card identification number that provides a unique identification number for the SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CCID

The command returns the following message:

```
#CCID: <ICCID>
OK
```

AT#CCID=?

Test command returns the **OK** result code.

```
AT#CCID
#CCID: 89861109091740011006
OK
```

3.4.9. AT#QSS - Query SIM Status

Query SIM Status.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT#QSS=[<mode>]

Enables/disables the Query SIM Status unsolicited indication in the ME.
The format of the unsolicited indication is the following:

#QSS: <status>

The parameter is described in the Unsolicited field section.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|----------------------|
| <mode> | integer | 0 | Type of notification |

Values:

- 0 : disabled. It is only possible to query the current SIM status through read command AT#QSS?
- 1 : enabled. The ME informs at every SIM status change through the basic unsolicited indication where <status> range is 0...1
- 2 : enabled. The ME informs at every SIM status change through the basic unsolicited indication where <status> range is 0...3

Unsolicited field:

| Name | Type | Description |
|----------|---------|--------------------|
| <status> | integer | current SIM status |

Values:

-
- 0 : SIM not inserted
 - 1 : SIM inserted
 - 2 : SIM inserted, and PIN unlocked
 - 3 : SIM inserted and READY (SMS and Phonebook access are possible)
-

AT#QSS?

Read command reports whether the unsolicited indication **#QSS** is currently enabled or not, along with the SIM status, in the format:

#QSS: <mode>,<status>

The parameters are described in the previous sections.

AT#QSS=?

Test command returns the supported range of values for parameter **<mode>**.

3.4.10. AT+CRSM - Restricted SIM access

The command transmits to the UICC some specific commands and their required parameters.

3GPP TS 11.11
3GPP TS 31.101
3GPP TS 31.102

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CRSM=<command>[,<fileId>[,<P1>[,<P2>[,<P3>[,<data>]]]]]

Set command transmits to the UICC the specific command and its required parameters. The command response shows the status words and response data returned by the UICC in the format:

+CRSM: <sw1>,<sw2>[,<response>]

For parameters meanings see Additional info section.

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-----------|---------|-----|-------------------------------|
| <command> | integer | 176 | command passed on to the UICC |
|-----------|---------|-----|-------------------------------|

Values:

176 : READ BINARY

178 : READ RECORD

192 : GET RESPONSE

214 : UPDATE BINARY

220 : UPDATE RECORD

242 : STATUS

| | | | |
|-----------------------|---------|---|---|
| <fileId> | integer | - | identifier of an elementary data file on UICC; mandatory for every command except STATUS |
| <P1> | integer | 0 | parameter passed on to the UICC; it is mandatory for every command except GET RESPONSE and STATUS |
| | Value: | | |
| | 0÷255 | : | parameter P1 passed on to the UICC in a command APDU |
| <P2> | integer | 0 | parameter passed on to the UICC; it is mandatory for every command except GET RESPONSE and STATUS |
| | Value: | | |
| | 0÷255 | : | parameter P2 passed on to the UICC in a command APDU |
| <P3> | integer | 0 | parameter passed on to the UICC; it is mandatory for every command except GET RESPONSE and STATUS |
| | Value: | | |
| | 0÷255 | : | parameter P3 passed on to the UICC in a command APDU |
| <data> | string | - | information to be read from UICC or written to the UICC (hexadecimal character format). |

Additional info:

►► Response data fields:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-------------------------|---------|---|--|
| <sw1> | integer | - | information from the UICC about the execution of the actual command (successful or failed) |
| <sw2> | integer | - | information from the UICC about the execution of the actual command (successful or failed) |
| <response> | hex | - | on a successful completion of the previously issued command it shows the response data. It is not returned after a successful UPDATE BINARY or UPDATE RECORD command |

AT+CRSM=?

Test command returns the **OK** result code

 Read binary, ICCID(2FE2)

```
AT+CRSM=176,12258,0,0,10
+CRSM: 144,0,982850702001107686F4
OK
```

Read record, ADN(6F3A)

```
AT+CRSM=178,28474,1,4,40
+CRSM:
144,0,42434A554EFFFFFFFFFFFFFFFFFFFFFFFF06811056789282FFFFFFFFFFFFFFFF
OK
```

Update Binary, KcGPRS(6F52)

```
AT+CRSM=214,28539,0,0,8,C69018C7958C87
+CRSM: 144,0
OK
```

Update Record, ADN(6F3A)

```
AT+CRSM=220,28474,9,4,30,657469FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
FFFF FFFFFFFFFFFFFF
+CRSM: 144,0
OK
```

Status, FPLMN(6F7B)

```
AT+CRSM=242,28539
+CRSM:144,0,623C820238218410A0000000871002FFFFFFFF89040300FFA511800131
81030 10A3282011E8304000030E08A01058B032F0609C6099001C0830101830181
OK
```

3.4.11. AT+CSIM - Generic SIM Access

This command sends a generic command to the UICC.

- [1] 3GPP TS 11.11
- [2] 3GPP TS 31.101
- [3] 3GPP TS 31.102

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CSIM=<length>,<command>

Set command transmits to the MT the <command>, it then shall send as it is to the UICC. As response to the command, MT sends back the actual UICC <response> to the TA as it is. The response message of the command is in the format:

+CSIM: <length>,<response>

Error case:

+CME ERROR: <err>

The response messages parameters are described in the Additional info section.

Parameters:

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <length> | integer | - | characters number of the <command> sent to UICC (two times the actual length of the command) |
| <command> | string | - | command passed on by the MT to the UICC in the format as described in standard [1] or [2] (hexadecimal character format, refer to +CSCS) |

Additional info:

- ▶▶ List of the meaning of the response messages parameters.

| Name | Type | Default | Description |
|------------|---------|---------|--|
| <length> | integer | - | characters number of the <response> sent to TE (two times the actual length of the response) |
| <response> | string | - | response to the command passed on by the UICC to the TE in the format as described in standard [1] or [2] (hexadecimal character format) |
| <err> | string | - | error values (numeric format followed by verbose format) |

AT+CSIM=?

Test command returns the **OK** result code.

AT+CSIM=<lock>

This special form of the command has no effect and is kept only for backward compatibility.

Parameters:

<lock>=1 locking of the interface

<lock>=0 unlocking of the interface

3.4.12. AT+CCHO - Open Logical Channel

Open Logical Channel

3GPP TS 31.101

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CCHO=<dfname>

Execution of the command causes the MT to return <sessionId> to allow the TE to identify a channel that is being allocated by the currently selected UICC, which is attached to ME.

The currently selected UICC will open a new logical channel; select the application identified by the <dfname> received with this command and return a <sessionId> as the response.

The ME shall restrict the communication between the TE and the UICC to this logical channel.

The response message of the command is in the format:

+CCHO: < sessionId >

The <sessionId> is described in the Additional info section.

Error case:

+CME ERROR: <err>

Parameter:

| Name | Type | Default | Description |
|----------|--------|---------|---|
| <dfname> | string | - | all selectable applications in the UICC are referenced by a DF name coded on 1 to 16 bytes (hexadecimal character format; refer +CSCS). |

Additional info:

- ▶▶ **<sessionId>** returned by the **+CCHO** command.

| Name | Type | Default | Description |
|--------------------------|---------|---------|--|
| <sessionId> | integer | - | <p>session Id to be used to target a specific application on the smart card (e.g. (U)SIM, WIM, ISIM) using logical channels mechanism.</p> <p>Session Id is used when sending commands with Restricted UICC Logical Channel access +CRLA, or Generic UICC Logical Channel access +CGLA commands.</p> |

- i** The logical channel number is contained in the CLASS byte of an APDU command, thus implicitly contained in all APDU commands sent to a UICC.

In this case it will be up to the MT to manage the logical channel part of the APDU CLASS byte and to ensure that the chosen logical channel is relevant to the **<sessionId>** indicated in the AT command. Refer to 3GPP TS 31.101.

AT+CCHO=?

Returns the **OK** result code.

3.4.13. AT+CCHC - Close Logical Channel

Close a communication session.

3GPP TS 31.101

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CCHC=<sessionId>

Set command asks the ME to close a communication session with the active UICC. The ME shall close the previously opened logical channel. The TE will no longer be able to send commands on this logical channel. The UICC will close the logical channel when receiving this command.

Error case:

+CME ERROR: <err>

Parameter:

| Name | Type | Default | Description |
|--------------------------|---------|---------|--|
| <sessionId> | integer | - | a session Id to be used to target a specific application on the smart card (e.g. (U)SIM, WIM, ISIM) using logical channels mechanism. <sessionId> is returned by the +CCHO command. |

AT+CCHC=?

Test command returns the **OK** result code.

3.4.14. AT+CGLA - Generic UICC Logical Channel Access

This command is used to control the currently selected UICC on the TE.

- [1] 3GPP TS 11.11
- [2] 3GPP TS 31.101
- [3] 3GPP TS 31.102

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CGLA=<sessionId>,<length>,<command>

Set command transmits to the MT the **<command>** it then shall send as it is to the selected UICC. In the same manner the UICC **<response>** shall be sent back by the MT to the TA as it is. This command allows a direct control of the currently selected UICC by a distant application on the TE. The TE shall then take care of processing the received UICC information. The response of the command is in the format:

+CGLA: <length>,<response>

Error case:

+CME ERROR: <err>

The response messages parameters are described in the Additional info section.

Parameters:

| Name | Type | Default | Description |
|--------------------------|---------|---------|--|
| <sessionId> | integer | - | this parameter is the identifier of the session to be used in order to send the APDU commands to the UICC. It is mandatory to send commands to the |

| | | | |
|------------------------|---------|---|---|
| | | | UICC when targeting applications on the smart card using a logical channel other than the default channel (channel "0"). <sessionId> is returned by the +CCHO command. |
| <length> | integer | - | characters number of the <command> sent to UICC (two times the actual length of the command) |
| <command> | string | - | command passed on by the MT to the UICC in the format as described in standard [1] or [2] (hexadecimal character format; refer to +CSCS). |

Additional info:

- ▶ List of the meaning of the response messages parameters.

| Name | Type | Default | Description |
|-------------------------|---------|---------|--|
| <length> | integer | - | characters number of the <response> sent to TE (two times the actual length of the response) |
| <response> | string | - | response to the command passed on by the UICC to the TE in the format as described in standard [1] or [2] (hexadecimal character format) |
| <err> | string | - | error values (numeric format followed by verbose format) |

AT+CGLA=?

Test command returns the **OK** result code.

3.4.15. AT#VSIMSETPROF - Set Virtual SIM profile

This command selects which SIM has to be used, an external physical SIM or an internal Virtual SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#VSIMSETPROF=<profilId>[,<storeNewMode>]

Execution command is used to switch between the physical SIM, connected via the external physical SIM interface, and the Virtual SIM application, that resides inside the module's software.

Parameters:

| Name | Type | Default | Description |
|----------------|---------|---|---|
| <profilId> | integer | 0 | indicates the profile identifier. |
| Values: | | | |
| 0 | : | profile 0 represents the external physical SIM | |
| 1 | : | profile 1 represents the internal Virtual SIM application | |
| <storeNewMode> | integer | 1 | Flag to store <profilId> selection in file system |
| Values: | | | |
| 0 | : | do not store <profilId> in file system | |
| 1 | : | store <profilId> in file system | |

- i** SET, READ, TEST commands return always immediate ERROR if Virtual SIM application is not present\corrupted or wrong key is present

- i** **#VSIMSETPROF=1** returns immediate ERROR in case SIM profile is missing (i.e. **#SECT**, **#SECP** operations has not been performed yet)
- i** **#VSIMSETPROF=0** returns immediate ERROR in case physical SIM is missing
- i** Expect 3 - 4 seconds delay when SIM switch is performed in warm status (module already running) from physical SIM, 2 seconds from Virtual SIM
- i** If request is performed immediately after AT parser availability, it can require 3 seconds more. If first response is ERROR please retry, it could be due to booting process. To avoid that, send a TEST command before

AT#VSIMSETPROF?

Read command reports the current value of parameter in the format:

#VSIMSETPROF: <profilId>

A special value of 255 indicates that the physical SIM is selected, but a SIM is not inserted

AT#VSIMSETPROF=?

Test command reports the supported range of values for the input parameter.

3.4.16. AT#VSIMSTAT - Display general details of VSIM

This command displays the details associated with the VSIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#VSIMSTAT

Execution command returns a range of information about the VSIM with the follow format:

#VSIMSTAT: <simos state>,<last error>,<perso>,<perso error>

Additional info:

▶▶ Parameters description

| Name | Type | Default | Description |
|---------------|---------|---------|---------------|
| <simos state> | integer | N/A | State of VSIM |

Values:

- 0 : No SimOs present
- 1 : SimOs is present, but it is not running
- 2 : SimOs running
- 3 : SimOs disabled
- 4 : SimOs corrupted
- 5 : Generic fail
- 6 : SimOs timeout during startup

| | | | |
|---|---------|-----|-----------------------|
| <last error> | integer | 0 | last error |
| Value: | | | |
| 0 : No error | | | |
| <perso> | integer | N/A | personalization file |
| Values: | | | |
| 0 : No vsim_perso file present | | | |
| 1 : The vsim_perso file is present | | | |
| 2 : Error in the personalization file and presence of vsim_perso_err file | | | |
| <perso error> | string | N/A | personalization error |
| Values: | | | |
| 0 : No vsim_perso file present | | | |
| String : String taken from vsim_perso_err file | | | |

-  The value **<last error>** is always 0, because last error is not enabled until further enhancements

AT#VSIMSTAT=?

Test command returns **OK**.

3.4.17. AT#VSIMVER - Get SIM version

This command returns the version of the Virtual SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#VSIMVER

Execution command returns the Virtual SIM version followed by an **OK** at Newline, or **ERROR** if the Virtual SIM is not present or not active

- i To get the version from **AT#VSIMVER**, it is only needed that the Virtual SIM is running
- i The return string from **AT#VSIMVER** is a hexadecimal string, e.g.:
#VSIMVER: "02040A0C02040A0C02"
 Maximum length of the string is 66 chars.

AT#VSIMVER=?

Test command returns **OK**.

3.4.18. AT+ICCID - Read ICCID

Execution command reads on SIM the Integrated Circuit Card Identification (ICCID). It is the card identification number that provides a unique identification number for the SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+ICCID

The command returns the following message:

```
+ICCID: <ICCID>
```

AT+ICCID=?

Test command returns the **OK** result code.

AT#CCID

```
#CCID: 89861109091740011006
```

```
OK
```

3.4.19. AT#SIMINCFG - SIMIN Pin Configuration

This command allows to configure a GPIO pin as SIMIN pin (detect switch of SIM holder) and the polarity of the SIMIN pin.

[1] Telit Hardware Design Guide of the used module

[2] SIM Integration Design Guide, 80000NT10001A

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SIMINCFG=<GPIOPin>,<siminDetMode>

Set command allows to configure either a General Purpose I/O pin (GPIO) as SIMIN pin to detect the SIM presence, and its status according to the used SIM holder. Refer to document [1] to have information on the GPIO pins, see also document [2].

Parameters:

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <GPIOPin> | integer | 0 | number of the GPIO pin used as SIMIN pin. The GPIO pin range starts from 1; 0 is used to reset #SIMINCFG settings, it is the default value. 0 is the only value allowed for ME910G1 family |

Value:

0 : reset #SIMINCFG settings

| | | | |
|----------------|---------|---|---------------------------------------|
| <siminDetMode> | integer | 0 | status of SIMIN pin for SIM detection |
|----------------|---------|---|---------------------------------------|

Values:

- 0 : SIMIN pin LOW means SIM inserted, HIGH means SIM removed (for normal SIM holder).
- 1 : SIMIN pin LOW means SIM removed, HIGH means SIM inserted (for micro and nano SIM holder)

-  SIMIN pin works only if **#SIMDET** is set to 2 (Automatic SIM Detection).
If SIMIN pin is not connected to the SIM Holder, do not use **#SIMDET=2**.
-  On ML865G1 and ME310G1 families there is no dedicated SIMIN pin and **AT#SIMDET=1** is the default value.
To use a TGPIIO as SIMIN pin it has to be configured with:
AT#SIMINCFG= (stored in NVM) and **AT#SIMDET=2** (stored in the extended profile AT&P).
-  On ME910G1 family there is a dedicated SIMIN pin. So parameter **<GPIOPin>** is meaningless and can be set only to 0

AT#SIMINCFG?

Read command reports the parameters values in the format:

#SIMINCFG: <GPIOPin>, <siminDetMode>

AT#SIMINCFG=?

Test command reports supported values of parameters **<GPIOPin>** and **<siminDetMode>**.

Modules supporting the command

| Modules supporting the command | |
|--------------------------------|--------|
| ME310G1- | W1, WW |
| ML865G1- | WW |
| ME910G1- | W1, WW |

3.4.20. AT#SIMSELGPIOCFG - SIM Select

If the module has the SIM on Chip, this command allows to select SIM on Chip (eSIM) or external (plastic) SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SIMSELGPIOCFG=<type>

Set command allows to activate eSIM or plastic SIM.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|-------------|
| <type> | integer | 1 | SIM type |

Values:

0 : eSIM

1 : plastic SIM

AT#SIMSELGPIOCFG?

Read command reports the activated SIM, in the format:

#SIMSELGPIOCFG: <type>

AT#SIMSELGPIOCFG=?

Test command reports the supported range of values for parameter <type>.

3.4.21. AT#FWAUTOSIM - Automatic Switch of Firmware Image by SIM

This command allows to set automatically the active firmware image in accordance with the inserted SIM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#FWAUTOSIM=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 0 | disable/enable automatic setting of active firmware image switch by SIM |

Values:

0 : disable

1 : enable

-  When automatic setting of active firmware image switch by SIM has been enabled (<mode>=1), system reboot is automatic only if active image must be changed to be in accordance with the inserted SIM. The **#FWAUTOSIM** command supports AT&T and Verizon SIMs.

See also **#FWSWITCH** command.

AT#FWAUTOSIM?

Read command returns the current setting in the format:

#FWAUTOSIM: <mode>

 **AT#FWAUTOSIM=?**

Test command returns the supported range of values for parameter **<mode>**.

3.4.22. AT#FIRSTNET - APN Automatic Switch by SIM

This command is the functionality to enable or disable APN automatic switch.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#FIRSTNET=<mode>

This command allows to set APN automatic switch mode by SIM.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 1 | Enable / Disable APN automatic switch by SIM |

Values:

- 0 : Disable APN automatic switch by SIM
- 1 : Enable APN automatic switch by SIM

-  This command is for AT&T (fwswitch 0); it allows to view an APN table for firstnet SIM that is different from showed APN table in case of a AT&T normal SIM.

AT#FIRSTNET?

Read command reports the current stored parameter:

#FIRSTNET: <mode>

AT#FIRSTNET=?

Test command reports the supported range of values for parameter:

#FIRSTNET: (0,1)

3.5. SIM Toolkit

3.5.1. AT#STIA - SIM/USIM Toolkit Interface Action

The SIM/USIM Application Toolkit (SAT/USAT) provides an interface to the applications existing in the SIM/USIM device. The module must support the mechanisms required by the SIM/USIM applications.

[1] 3GPP TS 23.038

[2] 3GPP TS 31.111

[3] Telit SIM/USIM Application Toolkit Application Note

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#STIA=[<mode>[,<timeout>]]

Set command is used to enable/disable the SIM/USIM Application Toolkit (SAT/USAT). In addition, the command can enable the URCs sending.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | 1 | enables/disables SAT/USAT. In addition, <mode> parameter enables the: |
| | | 31. | #STN URCs notifying the user that the SIM/USIM application has issued a proactive command. Some proactive commands require a user response |
| | | 32. | #STN URCs that are the SIM/USIM device responses concerning |

actions initiated by the user, refer to Additional info section.

If **<mode>=2**, the URC format depends on the **<cmdType>** as described in the Additional info sections. For **<cmdType>**, and all other URC parameters refer to **#STGI** command. The **<mode>** parameter values are listed below.

Values:

- 0 : disable SAT/USAT
- 1 : enable SAT/USAT without #STN URC
- 2 : enable SAT/USAT and extended #STN URC
- 3 : enable SAT/USAT and reduced #STN URC
- 17 : enable SAT/USAT without #STN URC and the alphabet used
- 18 : enable SAT/USAT, extended #STN URC, and the alphabet used
- 19 : enable SAT/USAT, reduced #STN URC, and the alphabet used
- 33 : enable SAT/USAT without #STN URC and the UCS2 alphabet used
- 34 : enable SAT/USAT, extended #STN URC, and the UCS2 alphabet used
- 35 : enable SAT/USAT, reduced #STN URC, and the UCS2 alphabet used

| | | | |
|------------------------|---------|---|--|
| <timeout> | integer | 2 | When an ongoing proactive command, requiring a user response, is not answered before <timeout> minutes, it is automatically aborted. In this case, the terminal response from the module is either "ME currently unable to process command" or, if applicable, "No response |
|------------------------|---------|---|--|

from user". In addition, the following URC is sent on the AT interface. For parameter meaning of the URC refer to Unsolicited fields section.

#STN:<cmdTerminateValue>

Follows the <timeout> range.

Value:

1,2 : timeout expressed in minutes

Additional info:

- ▶ <mode>=3, the URC has the following reduced format: **#STN: <cmdType>**

- ▶ <mode>=2, and <cmdType>=1 (REFRESH proactive command), the URC has the following extended format:
#STN: 1,<refreshType>

- ▶ <mode>=2, and <cmdType>=5 (SET UP EVENT LIST proactive command), the URC has the following extended format:
#STN: 5[,<eventListMask>]

- ▶ <mode>=2, and <cmdType>=16 (SET UP CALL proactive command), the URC has the following extended format:
#STN: 16,<cmdDetails>[,<confirmationText>],<calledNumber>

- ▶ <mode>=2, and one of the following proactive command:
 - <cmdType>=17 (SEND SS)
 - <cmdType>=18 (SEND USSD)
 - <cmdType>=19 (SEND SHORT MESSAGE)
 - <cmdType>=20 (SEND DTMF)

<cmdType>=32 (PLAY TONE)
<cmdType>=52 (RUN AT COMMAND)
<cmdType>=64 (OPEN CHANNEL)
<cmdType>=65 (CLOSE CHANNEL)
<cmdType>=66 (RECEIVE DATA)
<cmdType>=67 (SEND DATA)

the URC has the following extended format:

#STN: <cmdType>[,<alphaIdentifier>]

If <cmdType>=19 (SEND SHORT MESSAGE proactive command) fails, the **#STN: 119** URC is sent to the module.

- ▶ **<mode>=2**, and **<cmdType>=33** (DISPLAY TEXT proactive command), the URC is sent if allowed by SIM/USIM, the extended format is:

#STN: 33[,<cmdDetails>[,<alphaIdentifier>]]

If bit 7 of <cmdDetails>=1, the response with the **#STSR** command is required.

- ▶ **<mode>=2**, and **<cmdType>=34** (GET INKEY proactive command), the URC has the following extended format:

#STN: 34,<cmdDetails>,<text>

- ▶ **<mode>=2**, and **<cmdType>=35** (GET INPUT proactive command), the URC has the following extended format:

#STN: 35,<cmdDetails>,<text>,<responseMin>,<responseMax>[,<defaultText>]

- ▶ **<mode>=2**, and **<cmdType>=36** (SELECT ITEM proactive command), the URC has the following extended format:

the first line of output is:

#STN: 36,<cmdDetails>,<numOfItem>[,<titleText>]<CR><LF>

one line follows for every item, repeated <numOfItems> times:

#STN: 36,<itemId>,<itemText>[,<nextActionId>]

- ▶ **<mode>=2**, and **<cmdType>=37** (SET UP MENU proactive command), the URC has the following extended format:

the first line of output is:

```
#STN: 37,<cmdDetails>,<numOfItem>,<titleText><CR><LF>
```

one line follows for every item, repeated for **<numOfItems>**:

```
#STN: 37,<itemId>,<itemText>[,<nextActionId>]
```

- ▶ **<mode>=2**, and **<cmdType>=40** (SET UP IDLE MODE TEXT proactive command), the URC has the following extended format:

```
#STN: 40[,<idleModeTextString>]
```

- ▶ This Additional info section deals with the action initiated by the user (no proactive commands activated by the SIM/USIM device).

If the call control or SMS control facility present in the SIM/USIM device is activated, when the user application makes an outgoing call, or sends a SS or USSD, or a SMS, the following **#STN** URC could be sent to indicate whether the outgoing call has been accepted, rejected or modified by the SIM, or if the SMS service center address or destination has been changed. For parameters meaning refer to Unsolicited fields section.

#STN:

```
<cmdControlResponse>,<Result>[,<alphaIdentifier>[,<Number>[,<MODestAddr>]]]
```

Unsolicited fields:

| Name | Type | Description |
|-----------------------------------|---------|--|
| <cmdTerminateValue> | integer | is defined as <cmdType> + terminate offset. Terminate offset = 100 |
| <cmdControlResponse> | integer | response of the SIM/USIM device Values: |

| | | | |
|--------------------------------|---------|---|--------------------------------------|
| | | 150 | : SMS control response |
| | | 160 | : call/SS/USSD response |
| <Result> | integer | identify the result of the Call or SMS control performed by SIM/USIM device | |
| | | Values: | |
| | | 0 | : Call/SMS not allowed |
| | | 1 | : Call/SMS allowed |
| | | 2 | : Call/SMS allowed with modification |
| <alphaIdentifier> | string | optional text provided by the SIM/USIM device in ASCII format | |
| <Number> | string | Called number, Service Center Address or SS String in ASCII format | |
| <MODestAddr> | string | MO destination address in ASCII format | |

- i** The settings are saved on user profile and available on following reboot. SIM/USIM Toolkit activation/deactivation is only performed at power on according to the saved setting.
- i** If **AT#ENS=1**, the **<mode>** parameter is set to 2.
- i** Just one instance at a time, the one which first issued **AT#STIA=<mode>** (with **<mode>** not equal to 0), is allowed to issue SAT/USAT commands, and this is valid till the same instance issues **AT#STIA=0**. After reboot, SAT/USAT can be used on another instance.

AT#STIA?

Read command can be used to get information about the SAT/USAT interface. The message format is:

#STIA: <state>,<mode>,<timeout>,<SatProfile>

Additional info:

►► Returned parameters.

| Name | Type | Default | Description |
|--|---------|---------|---|
| <state> | integer | N/A | state of the sending of the SET UP MENU proactive command (37) |
| Values: | | | |
| 0 : SIM/USIM has not sent the SET UP MENU proactive command (37) | | | |
| 1 : SIM/USIM has sent the SET UP MENU proactive command (37) | | | |
| <mode> | integer | - | refer to Set section |
| <timeout> | integer | - | refer to Set section |
| <SatProfile> | string | - | SAT/USAT Terminal Profile. Is the list of SIM/USIM Application Toolkit facilities supported by the ME. The profile cannot be changed by the TA. |

- i** In SAT/USAT applications an SMS message is usually sent to the network provider containing service requests, e.g. to send the latest news. The provider returns a message with the requested information. Before activating SAT/USAT, it is recommended to set the SMS text mode with the **AT+CMGF=1** command and enable URC for incoming SMS messages with **+CNMI** command.

? AT#STIA=?

Test command returns the range of available values for the parameters <mode> and <timeout>.

3.5.2. AT#STGI - SIM Toolkit Get Information

The **#STGI** command interfaces to the SIM/USIM Application Toolkit to get information on the ongoing *proactive command*.

3GPP TS 31.111

Telit SIM/USIM Application Toolkit Application Note

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#STGI=[<cmdType>]

Set command gets parameters of the ongoing *proactive command*. The command can be used after the reception of the **#STN: <cmdType>** URC. If no proactive command is ongoing, **#STGI** returns an **ERROR** message.

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <cmdType> | integer | N/A | proactive command code. For each proactive command listed below, its #STGI response format is described in the Additional info sections. |

Values:

- 1 : REFRESH
- 5 : SET UP EVENT LIST
- 16 : SET UP CALL
- 17 : SEND SS
- 18 : SEND USSD
- 19 : SEND SHORT MESSAGE

- 20 : SEND DTMF
- 32 : PLAY TONE
- 33 : DISPLAY TEXT
- 34 : GET INKEY
- 35 : GET INPUT
- 36 : SELECT ITEM
- 37 : SET UP MENU
- 40 : SET UP IDLE MODE TEXT

Additional info:

- ▶▶ **<cmdType>=1** (REFRESH proactive command)
- #STGI** response format:
- #STGI: 1,<refreshType>**

| Name | Type | Default | Description |
|----------------------------|---------|---------|-----------------------------|
| <refreshType> | integer | N/A | identifies the refresh type |

Values:

- 0 : SIM Initialization and Full File Change Notification
- 1 : File Change Notification
- 2 : SIM Initialization and File Change Notification
- 3 : SIM Initialization
- 4 : SIM Reset
- 5 : NAA Application Reset
- 6 : NAA Session Reset

7 : Steering of Roaming

8 : Steering of Roaming WLAN

►► <cmdType>=5 (SET UP EVENT LIST proactive command)

#STGI response format:

#STGI: 5,<eventListMask>

| Name | Type | Default | Description |
|-----------------|------|---------|--|
| <eventListMask> | hex | N/A | <p>identifies the list of events to monitor.</p> <p>The <eventListMask> (two bytes long) is a bit mask where each bit, when set, indicates that the corresponding event must be monitored (e.g. if <eventListMask> is 0x0001, it means that MT call must be monitored).</p> <p>33. bit 0 = MT call</p> <p>34. bit 1 = Call connected</p> <p>35. bit 2 = Call disconnected</p> <p>36. bit 3 = Location status</p> <p>37. bit 4 = User activity</p> <p>38. bit 5 = Idle screen available</p> <p>39. bit 6 = Card reader status (if class "a" is supported)</p> <p>40. bit 7 = Language selection</p> <p>41. bit 8 = Browser Termination (if class "c" is supported)</p> <p>42. bit 9 = Data available (if class "e" is supported)</p> <p>43. bit 10 = Channel status (if class "e" is supported)</p> <p>44. bits 11 - 15 = reserved for future use</p> |

Value:

0x0001÷0x01FF : mask

►► <cmdType>=16 (SET UP CALL proactive command)

#STGI response format:

#STGI: 16,<cmdDetails>,[<confirmationText>],<calledNumber>

| Name | Type | Default | Description |
|--------------|---------|---------|--------------------------------|
| <cmdDetails> | integer | N/A | identifies the command details |

Values:

- 0 : set up call, but only if not currently busy on another call
- 1 : set up call, but only if not currently busy on another call, with redial
- 2 : set up call, putting all other calls (if any) on hold
- 3 : set up call, putting all other calls (if any) on hold, with redial
- 4 : set up call, disconnecting all other calls (if any)
- 5 : set up call, disconnecting all other calls (if any), with redial

| | | | |
|--------------------|--------|---|------------------------------------|
| <confirmationText> | string | - | string for user confirmation stage |
| <calledNumber> | string | - | string containing called numbers |

►► This section is dedicated to the following proactive commands:

<cmdType>=17 (SEND SS)
 <cmdType>=18 (SEND USSD)
 <cmdType>=19 (SEND SHORT MESSAGE)
 <cmdType>=20 (SEND DTMF)
 <cmdType>=32 (PLAY TONE)

#STGI response format:

#STGI: <cmdType>[,<alphaidentifier>]

| Name | Type | Default | Description |
|-------------------|--------|---------|---|
| <alphaidentifier> | string | - | optional text provided by the SIM/USIM device in ASCII format |

▶▶ <cmdType>=33 (DISPLAY TEXT proactive command)

#STGI response format:

#STGI: 33,<cmdDetails>[,<text>]

| Name | Type | Default | Description |
|--------------|------|---------|---|
| <cmdDetails> | hex | N/A | a bit mask where each bit position, according to its value, has a specific meaning: bit 0: 0 - normal priority 1 - high priority bits 1-6: reserved for future use bit 7: 0 - clear message after a delay 1 - wait for user to clear message |

Value:

0x00÷0xFF : mask

| | | | |
|--------|--------|---|--|
| <text> | string | - | text provided by the SIM/USIM device in ASCII format |
|--------|--------|---|--|

▶▶ **<cmdType>=34** (GET INKEY proactive command)

#STGI response format:

#STGI: 34,<cmdDetails>,<text>

| Name | Type | Default | Description |
|---------------------------|--------|---------|---|
| <cmdDetails> | hex | N/A | <p>a bit mask where each bit position, according to its value, has a specific meaning:</p> <p>bit 0: 0 - digits only (0-9, *, # and +) 1 - alphabet set</p> <p>bit 1: 0 - SMS default alphabet (GSM character set) 1 - UCS2 alphabet</p> <p>bit 2: 0 - character sets defined by bit 0 and bit 1 are enabled 1 - character sets defined by bit 0 and bit 1 are disabled and the "Yes/No" response is requested</p> <p>bits 3-6: 0</p> <p>bit 7: 0 - no help information available 1 - help information available</p> <p>Value: 0x00÷0x87 : mask</p> |
| <text> | string | - | string as prompt for test |

▶▶ **<cmdType>=35** (GET INPUT proactive command)

#STGI response format:

#STGI:

35,<cmdDetails>,<text>,<responseMin>,<responseMax>[,<defaultText>]

| Name | Type | Default | Description |
|--------------|--------|-----------|---|
| <cmdDetails> | hex | N/A | <p>a bit mask where each bit position, according to its value, has a specific meaning:</p> <p>bit 0: 0 - digits only (0-9, *, #, and +) 1 - alphabet set</p> <p>bit 1: 0 - SMS default alphabet (GSM character set) 1 - UCS2 alphabet</p> <p>bit 2: 0 - ME may echo user input on the display 1 - user input shall not be revealed in any way. Hidden entry mode is only available when using digit input. In hidden entry mode only characters ('0'-'9', '*' and '#') are allowed.</p> <p>bit 3: 0 - user input to be in unpacked format 1 - user input to be in SMS packed format</p> <p>bits 4-6: 0</p> <p>bit 7: 0 - no help information available 1 - help information available</p> |
| | | Value: | |
| | | 0x00÷0x8F | : mask |
| <text> | string | - | string as prompt for text |

| | | | |
|---------------------------------------|---------|-----|---|
| <responseMin> | integer | N/A | minimum number of characters of the user input |
| Value: | | | |
| 0÷255 : minimum length of user input. | | | |
| <responseMax> | integer | N/A | maximum number of characters of the user input. |
| Value: | | | |
| 0÷255 : maximum length of user input | | | |
| <defaultText> | string | - | string supplied as default response text |

►► **<cmdType>=36** (SELECT ITEM proactive command)

#STGI response format:

the first line of output is:

#STGI: 36,<cmdDetails>,<numOfItem>[,<titleText>]<CR><LF>

one line follows for every item, repeated **<numOfItems>** times:

#STGI: 36,<itemId>,<itemText>[,<nextActionId>]

| Name | Type | Default | Description |
|---------------------------|------|---------|---|
| <cmdDetails> | hex | N/A | <p>a bit mask where each bit position, according to its value, has a specific meaning:</p> <p>bit 0:</p> <p>0 - presentation type is not specified</p> <p>1 - presentation type is specified in bit 1</p> <p>bit 1:</p> <p>0 - presentation as a choice of data values if bit 0 = 1</p> <p>1 - presentation as a choice of navigation options if bit 0 is 1</p> |

bit 2:
 0 - no selection preference
 1 - selection using soft key preferred

bits 3-6:
 0

bit 7:
 0 - no help information available
 1 - help information available

Value:

0x00÷0x87 : mask

| | | | |
|---------------------------|---------|-----|-----------------------------|
| <numOfItems> | integer | - | number of items in the list |
| <titleText> | string | - | menu title string |
| <itemId> | integer | N/A | item identifier |

Value:

1÷numOfItems : item identifier range

| | | | |
|-----------------------------|---------|---|---|
| <itemText> | string | - | item title string |
| <nextActionId> | integer | - | is the code of next proactive command to be issued upon execution of the menu item. If <nextActionId> =0, no next action information available. |

►► **<cmdType>**=37 (SET UP MENU proactive command)

#STGI response format:

the first line of output is:

#STGI: 37,<cmdDetails>,<numOfItem>,<titleText><CR><LF>

one line follows for every item, repeated for **<numOfItems>**:

#STGI: 37,<itemId>,<itemText>[,<nextActionId>]

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-----------------------------|---------|--------------|---|
| <cmdDetails> | hex | N/A | a bit mask where each bit position, according to its value, has a specific meaning: bit 0: 0 - no selection preference 1 - selection using soft key preferred bit 1-6: 0 bit 7: 0 - no help information available 1 - help information available |
| | | Value: | |
| | | 0x00÷0x81 | : mask |
| <numOfItems> | integer | - | number of items in the list |
| <titleText> | string | - | menu title string |
| <itemId> | integer | N/A | item identifier |
| | | Value: | |
| | | 1÷numOfItems | : item identifier range |
| <itemText> | string | - | item title |
| <nextActionId> | integer | - | numerical code of next proactive command type to be issued upon execution of the menu item. If <nextActionId>=0 , no next action information available. |

►► **<cmdType>=40** (SET UP IDLE MODE TEXT proactive command)

#STGI response format:

#STGI: 40,<idleModeTextString>

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

<idleModeTextString> string - text provided by the SIM/USIM device in ASCII format

- i** The proactive commands are only those command types that use the AT interface. SAT/USAT commands which are not using the AT interface (not MMI related SAT commands, e.g. PROVIDE LOCAL INFORMATION) are executed without sending any indication to the user.

AT#STGI?

The read command returns the ongoing proactive command and the SAT/USAT state. The message format is:

#STGI: <state>,<cmdType>

Additional info:

- ▶▶ Returned parameters:

| Name | Type | Default | Description |
|------------------------|---------|---------|--|
| <state> | integer | - | state of the sending of the SET UP MENU proactive command (37), refer to AT#STIA? command |
| <cmdType> | integer | - | ongoing proactive command code |

AT#STGI=?

Test command returns the supported values of parameters **<state>** and **<cmdType>**.

- A typical SAT/USAT session, running on AT interface, starts when the user receives the **#STN: 37** URC. The unsolicited result code must be previously enabled by the **#STIA** command. The **#STN: 37** notifies the user that the main menu of the SIM/USIM Application has been sent to TA, and TA has stored the just received menu. Later, at any time, you can type in the **AT#STGI=37** command to display the main menu of the SIM/USIM Application on TE.

Upon receiving the **#STGI** response, you must enter the **#STSR** command to confirm the execution of the *proactive command* and provide any required user response. In this case, you must enter the **AT#STSR=37,0,x** command to select the **x** item of the SIM/USIM Application menu.

The **#STN: 237** URC indicates that the main menu of the SIM/USIM Application has been removed from TA, and it is no longer available. In this case, **AT#STGI=37** command returns **ERROR** message.

3.5.3. AT#STSR - SIM Toolkit Send Response

This command allows the user to provide a response to confirm the execution of the ongoing proactive command.

3GPP TS 31.111

Telit SIM/USIM Toolkit Application Note

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#STSR=[<cmdType>[,<userAction>[,<data>]]]

The set command allows the user to provide a response action to the ongoing proactive command when the action is required by the command itself.

Parameters:

| Name | Type | Default | Description |
|--------------|---------|---------|--|
| <cmdType> | integer | - | proactive command code, refer to #STGI command to have information on the <cmdType> |
| <userAction> | integer | 0 | identify the user action |

Values:

- 0 : the user accepts the ongoing proactive command
- 16 : proactive SIM/USIM session terminated by user
- 17 : backward move in the proactive SIM/USIM session requested by the user
- 18 : no response from user
- 19 : help information required by the user

- 20 : USSD/SS Transaction terminated by user
- 32 : TA currently unable to process command
- 34 : user has denied SIM/USIM call setup request
- 35 : user cleared down SIM/USIM call before connection or network release

| | | | |
|---------------------|--------|---|---|
| <data> | string | - | data entered by user, see Additional info section |
|---------------------|--------|---|---|

Additional info:

- ▶▶ **<data>** parameter is used according to **<cmdType>**, and when **<userAction>=0**:

- 45. **<cmdType>=34** (GET INKEY proactive command)
<data> contains the key pressed by the user. The character set is selected by **+CSCS** command.

If the ongoing proactive command requires to the user a binary choice (yes/no), the valid content of **<data>** is:

- "Y" or "y" (positive answer) and "N" or "n" (negative answer) for "IRA", "8859-1", "PCCP437" character sets
- "0079" or "0059" (positive answer) and "006E" or "004E" (negative answer) for UCS2 alphabet

The ongoing proactive command to require a binary choice sets bit 2 of the **<cmdDetails>** parameter to 1, see **#STGI** command.

- 46. **<cmdType>=35** (GET INPUT proactive command).
<data> contains the string of characters entered by the user.
- 47. **<cmdType>=36** (SELECT ITEM proactive command).
<data> contains the item identifier selected by the user.

- i** `<userAction>=0` is used, for example, to
 48. accept a call when the ongoing proactive command is SET UP CALL, `<cmdType>=16`
 49. start a connection when the ongoing proactive command is OPEN CHANNEL, `<cmdType>=64`
- i** Use of icons is not supported. All icon related actions will respond with no icon available.

AT#STSR?

The read command returns the ongoing proactive command and the SAT/USAT interface state. The format message is:

#STSR: `<state>`,`<cmdType>`

If there is no ongoing proactive command, an **ERROR** message is returned.

Additional info:

- ▶▶ Returned parameters.

| Name | Type | Default | Description |
|------------------------------|---------|---------|---|
| <code><state></code> | integer | - | state of the sending of the SET UP MENU proactive command (37), refer to AT#STIA? command |
| <code><cmdType></code> | integer | - | proactive command code, refer to #STGI command to have information on the <code><cmdType></code> |

 **AT#STSR=?**

The test command returns the range for the parameters **<state>** and **<cmdType>**.

3.6. SMS & CB

3.6.1. AT+CSMS - Select Message Service

Set command selects messaging service <service>

3GPP TS 27.005
3GPP TS 23.040
3GPP TS 23.041

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CSMS=[<service>]

Set command selects messaging service <service>. It returns the types of messages supported by the ME:

+CSMS: <mt>,<mo>,<bm>

For parameters meaning see Additional info section.

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|------------------------|
| <service> | integer | 0 | Select Message Service |

Values:

0 : 3GPP TS 23.040 and 3GPP TS 23.041. The syntax of SMS AT commands is compatible with 3GPP TS 27.005

- 1 : 3GPP TS 23.040 and 3GPP TS 23.041. The syntax of SMS AT commands is compatible with 3GPP TS 27.005. The requirement of <service> setting 1 is mentioned under corresponding command descriptions

Additional info:

- ▶▶ Parameters meaning of the returned message.

| Name | Type | Default | Description |
|------|---------|---------|-------------------------------------|
| <mt> | integer | 0 | mobile terminated messages support: |
| | | | Values: |
| | | 0 | : type not supported |
| | | 1 | : type supported |
| <mo> | integer | 0 | mobile originated messages support |
| | | | Values: |
| | | 0 | : type not supported |
| | | 1 | : type supported |
| <bm> | integer | 0 | broadcast type messages support |
| | | | Values: |
| | | 0 | : type not supported |
| | | 1 | : type supported |

AT+CSMS?

Read command reports current service setting along with supported message types in the format:

+CSMS: <service>, <mt>, <mo>, <bm>

?  AT+CSMS=?

Test command reports the supported value of the parameter <service>

3.6.2. AT+CPMS - Preferred Message Storage

The command selects the memory storage used by SMs (Short Messages).

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CPMS=<memr>[,<memw>[,<mems>]]

Set command selects memory storages <memr>, <memw> and <mems> to be used for reading, writing, sending and storing SMs

The command returns the memory storage status in the format:

+CPMS: <usedr>,<totalr>,<usedw>,<totalw>,<useds>,<totals>

The returned parameters are described in the Additional info section.

Parameters:

| Name | Type | Default | Description |
|----------------------------------|--------|---------|---|
| <memr> | string | SE | memory from which messages are read and deleted |
| Values: | | | |
| ME : SMS memory storage in Flash | | | |
| SE : SIM SMS memory storage | | | |
| <memw> | string | SM | memory to which writing and sending operations are made |
| Values: | | | |
| ME : SMS memory storage in Flash | | | |

SM : SIM SMS memory storage

<mems> string SM memory to which received SMs are preferred to be stored

Values:

ME : SMS memory storage in Flash

SM : SIM SMS memory storage

Additional info:

- ▶▶ Here is the meaning of the parameters returned by the command.

| Name | Type | Default | Description |
|-----------------------|---------|---------|--|
| <usedr> | integer | - | number of SMs stored in <memr> |
| <totalr> | integer | - | max number of SMs that <memr> can contain |
| <usedw> | integer | - | number of SMs stored in <memw> |
| <totalw> | integer | - | max number of SMs that <memw> can contain |
| <useds> | integer | - | number of SMs stored in <mems> |
| <totals> | integer | - | max number of SMs that <memw> can contain |

AT+CPMS?

Read command reports the message storage status.

+CPMS:<memr>,<usedr>,<totalr>,<memw>,<usedw>,<totalw>,<mems>,<useds>,<totals>

The parameters are described in previous sections.

 **AT+CPMS=?**

Test command reports the supported values for parameters <memr>, <memw> and <mems>.

```
</> AT+CPMS="SM","ME","SM"  
+CPMS: 1,20,27, 50,1,20  
OK
```

```
AT+CPMS?  
+CPMS: "SM",1,20,"ME",27, 50,"SM",1,20  
OK  
You have 1 out of 20 SMS SIM positions occupied
```

3.6.3. AT+CMGF - Message Format

Selects the format of SMS messages to be used in following SMS commands.

- 3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CMGF=[<mode>]

Set command selects the format of SMS messages used with send, list, read and write commands.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|----------------------------------|
| <mode> | integer | 0 | format to use for SMS operations |

Values:

0 : PDU mode

1 : text mode

AT+CMGF?

Read command reports the current value of the parameter <mode> in the format:

+CMGF: <mode>

AT+CMGF=?

Test command returns the supported values of parameter <mode>.

3.6.4. AT+CSCA - Service Center Address

This command allows to set the Service Center Address for SMS transmissions.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT+CSCA=<number>[,<type>]

Set command sets the Service Center Address to be used for mobile originated SMS transmissions

Parameters:

| Name | Type | Default | Description |
|----------|--------|---------|--|
| <number> | string | - | String type phone number of forwarding address in format specified by <type> parameter |

| | | | |
|--------|---------|-----|--------------------|
| <type> | integer | 145 | The type of number |
|--------|---------|-----|--------------------|

Values:

129 : National numbering scheme

145 : International numbering scheme (contains the character "+")

AT+CSCA?

Read command reports the current value of the SCA in the format:

+CSCA: <number>,<type>

-
-  If SCA is not present the device reports an error message.
-

AT+CSCA=?

Test command returns the **OK** result code.

-  To use the SM service, is mandatory to set a Service Center Address at which service requests will be directed.
-  In Text mode, this setting is used by send and write commands; in PDU mode, setting is used by the same commands, but only when the length of the SMSC address coded into the <pdu> parameter equals zero.
-  The current settings are stored through **+CSAS**

```
</> AT+CSCA="821029190903",145
OK
```

```
AT+CSCA?
+CSCA: "+821029190903",145
OK
```

3.6.5. AT+CSMP - Set Text Mode Parameters

This command is used to select values for additional parameters for storing and sending SMS when the text mode is used (**AT+CMGF=1**).

3GPP TS 27.005
3GPP TS 03.40/23.040
3GPP TS 03.38/23.038

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT+CSMP=[<fo>[,<vp>[,<pid>[,<dc>]]]]

Set command is used to select values for additional parameters for storing and sending SMS when the text mode is used (**AT+CMGF=1**).

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <fo> | integer | - | depending on the command or result code: first octet of 3GPP TS 03.40/23.040 SMS-DELIVER, SMS-SUBMIT (default 17), SMS-STATUS-REPORT, or SMS-COMMAND (default 2) in integer format. |
| <vp> | mixed | - | depending on SMS-SUBMIT <fo> setting: 3GPP TS 03.40/23.040 TP-Validity-Period either in integer format (default 167) or in quoted time-string format. |
| <pid> | integer | - | 3GPP TS 03.40/23.040 TP-Protocol-Identifier in integer format. |
| <dc> | integer | - | depending on the command or result code: 3GPP TS 03.38/23.038 SMS Data Coding Scheme (default 0), or Cell Broadcast Data Coding Scheme. |

AT+CSMP?

Read command returns the current setting in the format:

```
+CSMP: <fo>,<vp>,<pid>,<dc>
```

AT+CSMP=?

Test command returns the **OK** result code.

The current settings are stored through **+CSAS**

Set the parameters for an outgoing message with 24 hours of validity period and default properties:

```
AT+CSMP=17,167,0,0  
OK
```

3.6.6. AT+CSDH - Show Text Mode Parameters

This command controls whether detailed header information is shown in text mode.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CSDH=[<show>]

Set command controls whether detailed header information is shown in text mode (**AT+CMGF=1**) result codes.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <show> | integer | 0 | control the display of the result codes. |

Values:

0 : see Additional info section

1 : show the values in result codes

Additional info:

►► If <show>=0

do not show header values defined in commands **+CSCA** and **+CSMP** (<sca>, <tosca>, <fo>, <vp>, <pid> and <dcs>) nor <length>, <toda> or <tooa> in **+CMT**, **+CMGL**, **+CMGR** result codes for SMS-DELIVERs and SMS-SUBMITs in text mode.

For SMS-COMMANDs in **+CMGR** result code do not show <pid>, <mn>, <da>, <toda>, <length> or <cdata>

**AT+CSDH?**

Read command reports the current setting in the format:

+CSDH: <show>

**AT+CSDH=?**

Test command reports the supported range of values for parameter **<show>**.

3.6.7. AT+CSAS - Save Settings

Execution command saves settings which have been made by the **+CSCA**, and **+CSMP** commands in local non-volatile memory.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CSAS[=<profile>]

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <profile> | integer | 0 | Index of the profile where the settings are saved |

Values:

0 : it saves the settings to NVM

1÷n : SIM profile number; the value of <n> depends on the SIM.

- i** Certain settings may not be supported by the SIM and therefore they are always saved to NVM, regardless the value of <profile>.
- i** If parameter is omitted (AT+CSAS<CR> is given) the settings are saved in the non-volatile memory.

AT+CSAS=?

Test command returns the possible range of values for the parameter <profile>.

3.6.8. AT+CRES - Restore Settings

Execution command restores message service settings saved by **+CSAS** command from either NVM or SIM.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CRES[=<profile>]

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <profile> | integer | N/A | Defines which message service profiles to restore. |

Values:

- 0 : restores message service settings from NVM
- 1÷n : restores message service settings from SIM. The n value depends on the SIM.

- i** Certain settings may not be supported by the SIM and therefore they are always restored from NVM, regardless the value of **<profile>**
- i** If parameter is omitted the command restores message service settings from NVM.

AT+CRES=?

Test command returns the possible range of values for the parameter **<profile>**.

3.6.9. AT+CMMS - More Message to Send

Set command controls the continuity of SMS relay protocol link. When feature is enabled (and supported by network) multiple messages can be sent much faster as link is kept open.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CMMS=[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | 0 | enables/disables the relay protocol link continuity. |

Values:

- 0 : disable
- 1 : keep enabled until the time between the response of the latest message send command (+CMGS, +CMSS, etc.) and the next send command exceeds 5 seconds, then the link is closed and the parameter <n> is automatically reset to 0
- 2 : enable (if the time between the response of the latest message send command and the next send command exceeds 5 seconds, the link is closed but the parameter <n> remains set to 2)

i Entering **AT+CMMS=** returns **OK** but has no effect.

**AT+CMMS?**

Read command reports the current value of the parameter **<n>** in the format:

+CMMS: <n>

**AT+CMMS=?**

Test command returns the range of supported **<n>**

3.6.10. AT+CNMI - New Message Indications to Terminal Equipment

This command sets the parameters for receiving SMS messages.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CNMI=[<mode>[,<mt>[,<bm>[,<ds>[,<bfr>]]]]]

Set command selects the behavior of the device on how the receiving of new messages from the network is indicated to the DTE.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | unsolicited result codes buffering option. |

Values:

- 0 : Buffer unsolicited result codes in the TA. If TA result code buffer is full, indications can be buffered in some other place or the oldest indications may be discarded and replaced with the new received indications.
- 1 : Discard indication and reject new received message unsolicited result codes when TA-TE link is reserved, otherwise forward them directly to the TE.
- 2 : Buffer unsolicited result codes in the TA in case the DTE is busy and flush them to the TE after reservation. Otherwise forward them directly to the TE.
- 3 : if <mt> is set to 1, it enables the hardware ring line for 1 sec.

| | | | |
|-------------------|---------|---|---|
| <mt> | integer | 0 | result code indication reporting for SMS-DELIVER. |
|-------------------|---------|---|---|

Values:

- 0 : No SMS-DELIVER indications are routed to the TE and message is stored.
- 1 : If SMS-DELIVER is stored into ME/TA, indication of the memory location is routed to the TE using the URC described in Additional info section.
- 2 : SMS-DELIVERs (except class 2 messages and messages in the message waiting indication group) are routed directly to the TE using the URC described in the Additional info section.
- 3 : Class 3 SMS-DELIVERs are routed directly to TE using unsolicited result codes defined in <mt>=2. Messages of other data coding schemes result in indication as defined in <mt>=1.

| | | | |
|-------------------|---------|---|----------------------------|
| <bm> | integer | 0 | broadcast reporting option |
|-------------------|---------|---|----------------------------|

Values:

- 0 : Cell Broadcast Messages are not sent to the DTE
- 2 : New Cell Broadcast Messages are sent to the DTE with the URC described in Additional info section.

| | | | |
|-------------------|---------|---|-------------------------------------|
| <ds> | integer | 0 | SMS-STATUS-REPORTs reporting option |
|-------------------|---------|---|-------------------------------------|

Values:

- 0 : status report receiving is not reported to the DTE and is not stored
 - 1 : the status report is sent to the DTE with the URC described in the Additional info section.
-

2 : if a status report is stored, then the unsolicited result code, described in Additional info section, is sent.

| | | | |
|--------------------|---------|---|---------------------------------------|
| <bfr> | integer | 0 | buffered result codes handling method |
|--------------------|---------|---|---------------------------------------|

Values:

- 0 : TA buffer of unsolicited result codes defined within this command is flushed to the TE when <mode>=1..3 is entered (OK response shall be given before flushing the codes)
 - 1 : TA buffer of unsolicited result codes defined within this command is cleared when <mode>=1..3 is entered.
-

Additional info:

▶▶ <mt>=1:

+CMTI: <mems>,<index>

▶▶ <mt>=2:

PDU mode

+CMT: <alpha>,<length><CR><LF><PDU>

TEXT mode

+CMT:<oa>,<alpha>,<scts>[,<toa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>]<CR><LF> <data>

The parameters written in italics will be present depending on +CSDH last setting.

Class 2 messages and messages in the message waiting indication group (stored message) result in indication as defined in <mt>=1.

Acknowledge for the received SMS-DELIVER SM is sent to network immediately when **+CSMS <service>** is set to '0' or when **+CSMS <service>** is set to '1', acknowledge is sent via **+CNMA** command during predefine time-out, an error is sent to network in case timeout expire, next **+CMT** response is depend on acknowledge of current received **+CMT** response in case **+CSMS <service>** parameter set to '1'.

▶▶ **<bm>=2:**

PDU mode

+CBM: <length><CR><LF><PDU>

Text mode

+CBM: <sn>, <mid>, <dcs>, <pag>, <pags><CR><LF><data>

▶▶ **<ds>=1:**

PDU mode

+CDS: <length><CR><LF><PDU>

TEXT mode

+CDS: <fo>, <mr>, <ra>, <tora>, <scts>, <dt>, <st>

Acknowledge for the received SMS-STATUS-REPORT SM is sent to network immediately when **+CSMS <service>** is set to '0' or when **+CSMS <service>** is set to '1', acknowledge is sent via **+CNMA** command during pre-defined timeout, an error is sent to network in case timeout expire, next **+CDS** response is depend on acknowledge of current received **+CDS** response in case **+CSMS <service>** parameter set to '1'.

▶▶ **<ds>=2:**

+CDSI: <mems>,<index>

Unsolicited fields:

| Name | Type | Description |
|----------|---------|--|
| <mems> | string | memory storage where the new message is stored: "SM", "ME". |
| <index> | integer | location on the memory where SMS is stored. |
| <alpha> | string | alphanumeric representation of originator/destination number corresponding to the entry found in MT phonebook; used character set should be the one selected with command +CSCS . |
| <lenght> | integer | PDU length |
| <PDU> | string | PDU message |
| <oa> | string | originating address, string type converted in the currently selected character set (see +CSCS) |
| <alpha> | string | alphanumeric representation of <oa>; used character set should be the one selected with command +CSCS . |
| <scts> | string | arrival time of the message to the SC |
| <tooa> | integer | type of number <oa>: 129 - number in national format 145 - number in international format (contains the "+") |
| <fo> | string | first octet of message PDU, see 3GPP TS 03.40/23.040 |
| <pid> | string | Protocol Identifier |
| <dcs> | string | Data Coding Scheme |
| <sca> | string | Service Centre address, string type, converted in the currently selected character set (see +CSCS) |
| <tosca> | integer | type of number <sca>: 129 - number in national format 145 - number in international format (contains the "+") |

| | | |
|-----------------------|---------|---|
| <length> | integer | text length |
| <data> | string | TP-User-Data |
| | | 50. If <dcS> indicates that GSM 03.38 default alphabet is used and <fo> indicates that GSM 03.40 TP-User-Data-Header-Indication is not set (bit 6 of <fo> is 0), each character of GSM alphabet will be converted into current TE character set (see +CSCS). |
| | | 51. If <dcS> indicates that 8-bit or UCS2 data coding scheme is used or <fo> indicates that GSM 03.40 TP-User-Data-Header-Indication is set (bit 6 of <fo> is 1), each 8-bit octet will be converted into two IRA character long hexadecimal number (e.g. octet 0x2A will be converted as two characters 0x32 0x41). |
| | | Class 2 messages and messages in the "store" message waiting indication group result in indication as defined in <mt>=1 . |
| <sn> | integer | message serial number |
| <mid> | integer | message ID |
| <dcS> | string | Data Coding Scheme |
| <pag> | integer | page number |
| <pags> | integer | total number of pages of the message |
| <data> | string | CBM Content of Message |
| | | 52. If <dcS> indicates that GSM 03.38 default alphabet is used, each character of GSM alphabet will be converted into current TE character set (see +CSCS) |
| | | 53. If <dcS> indicates that 8-bit or UCS2 data coding scheme is used, each 8-bit octet will be converted into two IRA character long hexadecimal number (e.g. octet 0x2A will be converted as two characters 0x32 0x41) |

| | | |
|---------------------|---------|--|
| <mr> | integer | message reference number; 3GPP TS 23.040 TP-Message-Reference in integer format |
| <ra> | string | recipient address, string type, represented in the currently selected character set (see +CSCS) |
| <tora> | integer | type of number <ra> : 129 - number in national format 145 - number in international format (contains the "+") |
| <scts> | string | arrival time of the message to the SC |
| <dt> | string | sending time of the message |
| <st> | string | message status as coded in the PDU |

- i** DTR signal is ignored, hence the indication is sent even if the DTE is inactive (DTR signal is Low). In this case the unsolicited result code may be lost so if MODULE remains active while DTE is not, at DTE startup is suggested to check whether new messages have reached the device meanwhile with command **AT+CMGL=0** that lists the new messages received.

AT+CNMI?

Read command returns the current parameter settings for +CNMI command in the form:

+CNMI: <mode>,<mt>,<bm>,<ds>,<bfr>

? AT+CNMI=?

Test command reports the supported range of values for the +CNMI command parameters

```
AT+CMGF=1
OK
AT+CNMI=1,2,0,1,0
OK
```

```
Received message from network
+CMT: "+821020955219",,"07/07/26,20:09:07+36"
TEST MESSAGE
```

3.6.11. AT+CNMA - New Message Acknowledgement

This command is used to confirm the correct reception of a new message.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CNMA

Execution command confirms correct reception of a new message (SMS-DELIVER or SMS-STATUS-REPORT) which is routed directly to the TE.

Acknowledge with **+CNMA** is possible only if the **+CSMS** parameter is set to 1 (**+CSMS=1**) when a **+CMT** or **+CDS** indication is shown.

If no acknowledgement is given within the network timeout (17 seconds), an **RP-ERROR** is sent to the network, the **<mt>** and **<ds>** parameters of the **+CNMI** command are then reset to zero (do not show new message indication).

If command is executed, but no acknowledgement is expected, or some other ME related error occurs, result code **+CMS ERROR: <err>** is returned.

The AT command syntax and functionalities are different between SMS PDU Mode and SMS Text Mode, as explained in Additional info sections.

Additional info:

►► PDU Mode

AT+CNMA[=<n>[,<length>[<CR>PDU is given<ctrl-Z/ESC>]]]

Either positive (**RP-ACK**) or negative (**RP-ERROR**) acknowledgement to the network is possible. Parameter **<n>** defines which one will be sent. Optionally (when **<length>** is greater than zero) an acknowledgement TPDU (**SMS-DELIVER-REPORT** for **RP-ACK** or **RP-ERROR**) may be sent to the network.

The entering of PDU is done similarly as specified in command Send Message **+CMGS**, except that the SMSC address field is not present.

| Name | Type | Default | Description |
|----------|---------|---|-------------------------------------|
| <n> | integer | N/A | type of acknowledgement in PDU mode |
| Values: | | | |
| 0 | : | send RP-ACK without PDU (same as TEXT mode) | |
| 1 | : | send RP-ACK with optional PDU message | |
| 2 | : | send RP-ERROR with optional PDU message | |
| <length> | integer | - | length of the PDU message |

►► Text Mode

AT+CNMA

Only positive acknowledgement to network (**RP-ACK**) is possible.

? AT+CNMA=?

Test command returned information are different between SMS PDU Mode and SMS Text Mode, as explained below.

Additional info:

►► PDU Mode

Test command returns the possible range of values for the parameter <n>.

▶▶ Text Mode

Test command returns the **OK** result code.

- i** In case that a directly routed message must be buffered in ME/TA (possible when **+CNMI** parameter **<mode>** equals 0 or 2) or AT interpreter remains too long in a state where result codes cannot be sent to TE (e.g. user is entering a message using **+CMGS**), acknowledgement (**RP-ACK**) is sent to the network without waiting **+CNMA** command from TE.
- i** It has been necessary to take the following decision to get over any incoherence problem, due to the possibility to have contemporaneous different settings of parameter **<mt>** and **<ds>** of the **+CNMI** command in different sessions (see **#PORTCFG** and **+CMUX**): only the **<mt>** and **<ds>** setting for session "0" are considered as valid to decide if **+CNMA** acknowledgment is expected or not.

- PDU Mode

```
AT+CSMS=1
+CSMS: 1,1,1
OK
```

```
Set PDU mode.
AT+CMGF=0
OK
```

```
AT+CNMI=2,2,0,0,0
OK
```

```
Message is received from network.
+CMT: "",70
06816000585426000480980600F170110370537284...
```

```
Send positive acknowledgement to the network.
AT+CNMA=0
OK
```

```
Message is received from network.
+CMT: "",70
06816000585426000480980600F170110370537284...
```

```
Send negative acknowledgment (Unspecified error) to the network.
AT+CNMA=2,3<CR>
> 00FF00 <Ctrl-Z>
OK
```

- Text Mode

```
AT+CSMS=1
+CSMS: 1,1,1
OK
```

```
Set Text mode.
AT+CMGF=1
OK
```

```
AT+CNMI=2,2,0,0,0
OK
```

Message is received from network.
+CMT: "+821020955219",,"07/07/26,20:09:07+36"
TEST MESSAGE

Send positive acknowledgement to the network.
AT+CNMA
OK

3.6.12. AT+CMGL - List Messages

This command is used to list the messages.

3GPP TS 27.005
3GPP TS 23.040
3GPP TS 23.038

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CMGL[=<stat>]

Execution command reports the list of all the messages with status value **<stat>** stored into **<memr>** message storage (**<memr>** is the message storage for read and delete SMs as last settings of command **+CPMS**).

Parameter:

| Name | Type | Default | Description |
|---------------------|-------|---------|---|
| <stat> | mixed | - | <p><stat> parameter type and the command output depend on the last settings of the +CMGF command (message format to be used). There are two modes:</p> <p>54. PDU mode 55. Text mode</p> <p>See the following Additional info sections.</p> |

Additional info:

- ▶ When message format is PDU mode, the **<stat>** parameter is:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|---------------------|---------|-----|--------------|
| <stat> | integer | N/A | status value |
|---------------------|---------|-----|--------------|

Values:

0 : new message

1 : read message

2 : stored message not sent yet

3 : stored message already sent

4 : all messages

►► In case of PDU mode the representation format (see **+CMGF**) is:

+CMGL: <index>,<stat>,<alpha>,<length><CR><LF><pdu>[<CR><LF>

+CMGL: <index>,<stat>,<alpha>,<length><CR><LF><pdu>[...]]

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|----------------------|---------|---|---------------------------------------|
| <index> | integer | - | message position in the storage list. |
|----------------------|---------|---|---------------------------------------|

| | | | |
|---------------------|---------|---|--|
| <stat> | integer | - | message status. See the above <stat> parameter description. |
|---------------------|---------|---|--|

| | | | |
|----------------------|--------|---|--|
| <alpha> | string | - | String type alphanumeric representation of <da> or <oa> , corresponding to an entry found in the phonebook; used character set is the one selected with command +CSCS . |
|----------------------|--------|---|--|

| | | | |
|-----------------------|---------|---|---------------------|
| <length> | integer | - | PDU length in bytes |
|-----------------------|---------|---|---------------------|

| | | | |
|--------------------|--------|---|--|
| <pdu> | string | - | message in PDU format, according to 3GPP TS 23.040 |
|--------------------|--------|---|--|

►► When message format is TEXT mode, the **<stat>** parameter is:

| Name | Type | Default | Description |
|--------------|--------|-------------------------------|--------------|
| <stat> | string | N/A | status value |
| Values: | | | |
| "REC UNREAD" | | : new message | |
| "REC READ" | | : read message | |
| "STO UNSENT" | | : stored message not sent yet | |
| "STO SENT" | | : stored message already sent | |
| "ALL" | | : all messages | |

- In case of TEXT mode, the representation format for stored messages (either sent or unsent) or received messages (either read or unread, not message delivery confirm) is:

```
+CMGL:
<index>,<stat>,<oa/da>,<alpha>,<scts>[,<tooa/toda>,<length>]<CR><LF>
<data>[<CR><LF>
+CMGL:
<index>,<stat>,<oa/da>,<alpha>,<scts>[,<tooa/toda>,<length>]<CR><LF>
<data>[...]]
```

The information written in italics will be present depending on **+CSDH** last setting.

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <index> | integer | - | message position in the storage list. |
| <stat> | string | - | message status. See the above <stat> parameter description. |
| <oa/da> | string | - | originator/destination address, represented in the currently selected character set (see +CSCS). |

| | | | |
|--------------------------|---------|-----|---|
| <alpha> | string | - | The alphanumeric representation of <da> or <oa> , corresponding to an entry found in the phonebook; used character set is the one selected with command +CSCS . |
| <scts> | string | - | TP-Service Centre Time Stamp in Time String Format. |
| <tooa/toda> | integer | N/A | type of number <oa/da> Values: 129 : number in national format 145 : number in international format (contains the "+") |
| <length> | integer | - | text length |
| <data> | string | - | TP-User-Data If <dcs> indicates that 3GPP TS 23.038 default alphabet is used, each character of GSM alphabet will be converted into current TE character set (see +CSCS) If <dcs> indicates that 8-bit or UCS2 data coding scheme is used, each 8-bit octet will be converted into two IRA character long hexadecimal number (e.g. octet 0x2A will be converted as two characters 0x32 0x41) If <fo> indicates that a UDH is present each 8-bit octet will be converted into two IRA character long hexadecimal number. The <length> indicates text length in characters without UDH length. |

- In case of TEXT mode, the representation format for delivery confirm messages is:

+CMGL:

<index>,<stat>,<fo>,<mr>,<ra>,<tora>,<scts>,<dt>,<st>[<CR><LF>

+CMGL: <index>,<stat>,<fo>,<mr>,<ra>,<tora>,<scts>,<dt>,<st>[...]]

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <index> | integer | - | message position in the storage list. |
| <stat> | string | - | Message status. See the last <stat> parameter description. |
| <fo> | integer | - | first octet of the message PDU |
| <mr> | integer | - | message reference number; 3GPP TS 23.040 TP-Message-Reference in integer format |
| <ra> | string | - | recipient address, represented in the currently selected character set (see +CSCS) |
| <tora> | string | - | type of number <ra> |
| <scts> | string | - | arrival time of the message to the SC |
| <dt> | string | - | sending time of the message |
| <st> | integer | - | message status as coded in the PDU |

- i** If parameter is omitted the command returns the list of SMS with "REC UNREAD" status.
- i** The order in which the messages are reported by +CMGL corresponds to their position in the memory storage

 **AT+CMGL=?**

Test command returns a list of supported **<stat>s**

3.6.13. AT+CMGR - Read Message

This command is used to read a message.

3GPP TS 27.005
3GPP TS 23.040
3GPP TS 23.038

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CMGR=<index>

Execution command reports the message with location value <index> from <memr> message storage (<memr> is the message storage for read and delete SMs as last settings of command +CPMS).

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <index> | integer | - | message index. The command output depends on the last settings of command +CMGF (message format to be used). There are two modes: 56. PDU mode 57. Text mode |

See the following Additional info sections.

Additional info:

- ▶ In case of PDU mode, if there is a message in location <index>, the output has the following format:

+CMGR: <stat>,<alpha>,<length><CR><LF><pdu>

| Name | Type | Default | Description |
|-----------------------|---------|---------|--|
| <stat> | integer | N/A | status of the message |
| Values: | | | |
| | 0 | : | new message |
| | 1 | : | read message |
| | 2 | : | stored message not yet sent |
| | 3 | : | stored message already sent |
| <alpha> | string | - | string type alphanumeric representation of <da> or <oa> , corresponding to an entry found in the phonebook; used character set is the one selected with command +CSCS |
| <length> | integer | - | PDU length in bytes |
| <pdu> | string | - | message in PDU format, according to 3GPP TS 23.040 |

- In case of Text mode, if there is a received message in location **<index>**, the output has the following format (the information written in italics will be present depending on **+CSDH** last setting):

```
+CMGR:<stat>,<oa>,<alpha>,<scts>
[,<tooa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>]<CR><LF><data>
```

If there is either a sent or an unsent message in location **<index>** the output format is:

```
+CMGR:<stat>,<da>,<alpha>
[,<toda>,<fo>,<pid>,<dcs>,[<vp>],<sca>,<tosca>,<length>]<CR><LF><data>
```

If there is a Message Delivery Confirm message in location **<index>** the

output format is:

+CMGR: <stat>,<fo>,<mr>,,,<scts>,<dt>,<st>

| Name | Type | Default | Description |
|---------|--------------|---------|---|
| <stat> | string | N/A | status of the message |
| Values: | | | |
| | "REC UNREAD" | : | new received message |
| | "REC READ" | : | received message read |
| | "STO UNSENT" | : | message stored not yet sent |
| | "STO SENT" | : | message stored already sent |
| <fo> | integer | - | first octet of the message PDU |
| <mr> | integer | - | message reference number; 3GPP TS 23.040 TP-Message-Reference in integer format |
| <scts> | string | - | arrival time of the message to the SC |
| <dt> | string | - | sending time of the message |
| <st> | integer | - | message status as coded in the PDU |
| <pid> | integer | - | Protocol Identifier |
| <dcs> | integer | - | Data Coding Scheme |
| <vp> | mixed | - | Validity Period; its format depends on SMS-SUBMIT <fo> setting (see +CPMS): <ol style="list-style-type: none"> 1. Not present: if <fo> tells that Validity Period Format is not present 2. Integer: if <fo> tells that Validity Period Format is relative |

| | | | |
|----------------------|---------|-----|--|
| | | | 3. Quoted time-string type: if <fo> tells that Validity Period Format is absolute |
| | | | 4. Quoted hexadecimal representation of 7 octets: if <fo> tells that Validity Period Format is enhanced |
| <oa> | string | - | Originator address, represented in the currently selected character set (see +CSCS). |
| <da> | string | - | Destination address, represented in the currently selected character set (see +CSCS). |
| <alpha> | string | - | The alphanumeric representation of <da> or <oa> , corresponding to an entry found in the phonebook; used character set is the one selected with command +CSCS . |
| <sca> | string | - | Service Centre Address |
| <toa> | integer | N/A | type of number of <oa> |
| | Values: | | |
| | 129 | : | number in national format |
| | 145 | : | number in international format (contains the "+") |
| <toda> | integer | N/A | type of number of <da> |
| | Values: | | |
| | 129 | : | number in national format |
| | 145 | : | number in international format (contains the "+") |
| <tosca> | integer | N/A | type of number of <sca> |
| | Values: | | |

129 : number in national format

145 : number in international format (contains the "+")

| | | | |
|-----------------------|---------|---|--|
| <length> | integer | - | text length |
| <data> | string | - | <p>TP-User-Data</p> <p>If <dc> indicates that 3GPP TS 23.038 default alphabet is used, each character of GSM alphabet will be converted into current TE character set (see +CSCS)</p> <p>If <dc> indicates that 8-bit data coding scheme is used, each 8-bit octet will be converted into two IRA character long hexadecimal number (e.g. octet 0x2A will be converted as two characters 0x32 0x41)</p> |

- i** In both cases (in PDU or Text mode) if status of the message is 'received unread', status in the storage changes to 'received read'.

AT+CMGR=?

Test command returns the **OK** result code

```
AT+CMGF=0
OK
```

```

3.6.14. AT+CMGS - Send Short Message

The command is related to sending short messages.

3GPP TS 27.005
3GPP TS 23.040
3GPP TS 23.038

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CMGS

Execution command sends a short message to the network. It can have two syntax formats according to the SMS format: PDU or Text mode (see **+CMGF** command). If short message is successfully sent to the network, the result is shown with the following URC:

+CMGS: <mr>[,<scts>]

Additional info:

- ▶▶ In PDU mode the **+CMGS** command has the following syntax:

AT+CMGS=<length>

After command line is terminated with <CR>, the module responds sending a four-character sequence prompt:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

and waits for the specified number of bytes. the PDU shall be hexadecimal format (each octet of the PDU is given as two IRA character long hexadecimal number) and given in one line.

To send the message issue Ctrl-Z char (0x1A hex). To exit without sending the message issue ESC char (0x1B hex).

| Name | Type | Default | Description |
|-------------------------|---------|---------|---|
| <length> | integer | N/A | length in bytes of the PDU to be sent (excluding the SMSC address octets) |
| Value: | | | |
| 7÷164 : number of bytes | | | |

- In Text mode the **+CMGS** command has the following syntax:

AT+CMGS=<da>[,<toda>]

After command line is terminated with <CR>, the module responds sending a four-character sequence prompt:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

After this prompt, you can enter text that should be formatted as follows:

- if current <dcs> (see **+CSMP**) indicates that GSM03.38 default alphabet is used and current <fo> (see **+CSMP**) indicates that 3GPP TS 23.040 TP-User-Data-Header-Indication is not set, then ME/TA converts the entered text into GSM alphabet, according to 3GPP TS 27.005, Annex A; backspace can be used to delete last character and carriage returns can be used; after every <CR> entered by the user the sequence <CR><LF><greater_than><space> is sent to the TE.
- if current <dcs> (see **+CSMP**) indicates that 8-bit or UCS2 data coding scheme is used or current <fo> (see **+CSMP**) indicates that 3GPP TS 23.040 TP-User-Data-Header-

Indication is set, the entered text should consist of two IRA character long hexadecimal numbers which ME/TA converts into 8-bit octet (e.g. the 'asterisk' will be entered as 2A (IRA50 and IRA65) and this will be converted to an octet with integer value 0x2A)

To send the message issue Ctrl-Z char (0x1A hex). To exit without sending the message issue ESC char (0x1B hex).

| Name | Type | Default | Description |
|--------|--------|---------|---|
| <da> | string | - | destination address, string type represented in the currently selected character set (see +CSCS). |
| <toda> | string | 129 | type of destination address |

Values:

129 : number in national format

145 : number in international format (contains the "+")

Unsolicited fields:

| Name | Type | Description |
|--------|---------|---|
| <mr> | integer | TP-Message-Reference number as per 3GPP TS 23.040 |
| <scts> | string | TP-Service Centre Time Stamp in Time String Format. <scts> is returned when +CSMS <service> value is 1 and network supports. |

- i** The DCD signal shall be in **ON** state while data is entered. The echoing of data is controlled by echo command **E**.

-  in PDU mode: when the length of the SMSC address equals 0, then the SMSC address set with command **+CSCA** is used; in this case the SMSC Type of Address octet shall not be present in the data.
-  To ensure that during the command execution, which may take several seconds, no other SIM interacting commands issued, care must take.
-  It is possible to send a concatenation of at most 10 SMs; the maximum number of chars depends on the **<dc>**:
 7. 2448 chars
 8. 2144 chars if 8-bit is used
 9. 1072 chars if UCS2 is used
-  If message sending fails for some reason, then an error code is reported.

AT+CMGS=?

Test command returns the **OK** result code.

-  To avoid malfunctions is suggested to wait for the **+CMGS: <mr>** or **+CMS ERROR: <err>** response before issuing further commands.

To avoid malfunctions it is suggested to wait for the **+CMGS: <mr>** or **+CMS ERROR: <err>** response before issuing further commands.

OK
```

3.6.15. AT+CMSS - Send Message from Storage

This command sends to the network a message which is already stored in the **<memw>** storage.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CMSS=<index>[,<da>[,<toda>]]

Execution command sends to the network a message which is already stored in the **<memw>** storage (see **+CPMS**) at the location **<index>**.

Parameters:

| Name | Type | Default | Description |
|----------------------|---------|---------|---|
| <index> | string | - | location value in the message storage <memw> of the message to send |
| <da> | string | - | destination address, string type represented in the currently selected character set (see +CSCS); if it is given it shall be used instead of the one stored with the message. |
| <toda> | integer | N/A | type of destination address |

Values:

129 : number in national format

145 : number in international format (contains the "+")

Additional info:

- ▶▶ If message is successfully sent to the network then the result is sent in the format:
+CMSS: <mr>
where:
<mr> - message reference number.
If message sending fails for some reason, an error code is reported:
+CMS ERROR:<err>

- i** To store a message in the <memw> storage see command **+CMGW**.
- i** Care must be taken to ensure that during the command execution, which may take several seconds, no other SIM interacting commands are issued.

AT+CMSS=?

Test command returns the **OK** result code.

- i** To avoid malfunctions is suggested to wait for the **+CMSS: <mr>** or **+CMS ERROR: <err>** response before issuing further commands.

3.6.16. AT+CMGW - Write Short Message to Memory

The command is related to writing short messages.

3GPP TS 27.005
3GPP TS 23.040
3GPP TS 23.038

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CMGW

Execution command writes a new short message in the **<memw>** memory storage (see **+CPMS**). It can have two syntax formats according to the SMS format: PDU or Text mode (see **+CMGF** command). If short message is successfully written the following URC is displayed:

+CMGW: <index>

Additional info:

- ▶ In PDU mode the **+CMGW** command has the following syntax:

AT+CMGW=<length>[,<stat>]

After command line is terminated with **<CR>**, the module responds sending a four-character sequence prompt:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

and waits for the specified number of bytes.

To write the message issue Ctrl-Z char (0x1A hex). To exit without sending the message issue ESC char (0x1B hex).

| Name | Type | Default | Description |
|---|---------|---------|--|
| <length> | integer | N/A | length in bytes of the PDU to be written |
| Value: | | | |
| 7÷164 : number of bytes | | | |
| <stat> | integer | N/A | message status |
| Values: | | | |
| 0 : new message new message (received unread message; default for DELIVER messages (3GPP TS 23.040 SMS-DELIVER messages)) | | | |
| 1 : read message | | | |
| 2 : stored message not sent yet (default for SUBMIT messages (3GPP TS 23.040 SMS-SUBMIT messages)) | | | |
| 3 : stored message already sent | | | |
| <data> | hex | - | PDU bytes, given in online mode |

- In Text mode the **+CMGW** command has the following syntax:

AT+CMGW[=<da>[,<toda>[,<stat>]]]

After command line is terminated with <CR>, the module responds sending a four-character sequence prompt:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

After this prompt, you can enter text that should be formatted as follows:

10. if current **<dc>** (see +CSMP) indicates that GSM03.38/23.038 default alphabet is used and current **<fo>** (see +CSMP) indicates that 3GPP TS 03.40/23.040 TP-User-Data-Header-Indication is not set, then ME/TA converts the entered text into GSM alphabet, according to 3GPP TS 27.005, Annex A; backspace can be used to delete last character and carriage returns can be used..
11. if current **<dc>** (see +CSMP) indicates that 8-bit or UCS2 data coding scheme is used or current **<fo>** (see +CSMP) indicates that 3GPP TS 23.040 TP-User-Data-Header-Indication is set, the entered text should consist of two IRA character long hexadecimal numbers which ME/TA converts into 8-bit octet (e.g. the 'asterisk' will be entered as 2A (IRA50 and IRA65) and this will be converted to an octet with integer value 0x2A)

The command waits for the specified number of bytes.

To write the message issue Ctrl-Z char (0x1A hex). To exit without writing the message issue ESC char (0x1B hex).

| Name | Type | Default | Description |
|---|---------|---------|---|
| <da> | string | - | destination address, string type represented in the currently selected character set (see +CSCS). |
| <toda> | integer | N/A | type of destination address |
| Values: | | | |
| 129 : number in national format | | | |
| 145 : number in international format (contains the character "+") | | | |
| <stat> | string | N/A | message status |
| Values: | | | |

| | | |
|--------------|---|---------------------------------------|
| "REC UNREAD" | : | new received message unread |
| "REC READ" | : | received message read |
| "STO UNSENT" | : | message stored not yet sent (default) |
| "STO SENT" | : | message stored already sent |

Unsolicited field:

| Name | Type | Description |
|---------|---------|---|
| <index> | integer | message location index in the memory <memw> (see +CPMS). If message storing fails for some reason, an error code is reported. |

- i The DCD signal shall be in **ON** state while <data> is entered. The echoing of <data> is controlled by echo command **E**.
- i In PDU mode, not only SUBMIT messages can be stored in SIM, but also DELIVER and STATUS REPORT messages (3GPP TS 23.040 SMS-STATUS-REPORT messages). SUBMIT messages can only be stored with status 2 or 3; DELIVER and STATUS REPORT messages can only be stored with status 0 or 1.
- i Care must be taken to ensure that during the command execution, which may take several seconds, no other SIM interacting commands are issued.
- i It is possible to save a concatenation of at most 10 SMs; the maximum number of chars depends on <dc>:
 12. 2448 chars
 13. 2144 chars if 8-bit is used
 14. 1072 chars if UCS2 is used
- i In text mode, not only SUBMIT messages can be stored in SIM, but also DELIVER messages.

The type of saved message depends upon the current **<fo>** parameter (see **+CSMP**). For a DELIVER message, current **<vp>** parameter (see **+CSMP**) is used to set the message Service Centre Time Stamp **<scts>**, so it must be an absolute time string, e.g. "09/01/12,11:15:00+04".

SUBMIT messages can only be stored with status "STO UNSENT" or "STO SENT"; DELIVER messages can only be stored with status "REC UNREAD" or "REC READ".

-  If message writing fails for some reason, then an error code is reported.

AT+CMGW=?

Test command returns the **OK** result code.

To avoid malfunctions it is suggested to wait for the **+CMGW: <index>** or **+CMS ERROR: <err>** response before issuing further commands.

```
AT+CMGF=0      set PDU mode

3.6.17. AT+CMGD - Delete Message

This command allows to delete from memory messages.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CMGD=<index>[,<delflag>]

Execution command deletes SMS message(s) from a selected memory storage. Storage is selected by command **+CPMS**.

Parameters:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <index> | integer | - | Message index in the selected storage; it can have values form 1 to N, where N depends on the available space in the selected storage (see +CPMS) |
| <delflag> | integer | 0 | Type of multiple message deletion |

Values:

- 0 : delete message specified in <index>
- 1 : delete all read messages from selected storage, leaving unread messages and stored mobile originated messages (whether sent or not) untouched
- 2 : delete all read messages from selected storage and sent mobile originated messages, leaving unread messages and unsent mobile originated messages untouched

3 : delete all read messages from selected storage, sent and unsend mobile originated messages, leaving unread messages untouched

4 : delete all messages from selected storage.

i If **<delflag>** is present and not set to 0 then, if **<index>** is greater than 0, **<index>** is ignored and the command follows the rules for **<delflag>** shown above.

AT+CMGD=?

Test command shows the valid memory locations **<index>** and the supported values of **<delflag>**.

</> AT+CMGD=?
+CMGD: (1,2,3,6,7,17,18,19,20,37,38,39,47),(0-4)
OK

3.6.18. AT+CGSMS - Select Service for MO SMS Messages

Set command is used to specify the service or service preference that the MT will use to send MO SMS messages.

3GPP TS 27.005

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CGSMS=[<service>]

Parameter:

| Name | Type | Default | Description |
|-----------|---------|---------|--|
| <service> | integer | 1 | indicates the service or service preference to be used |

Values:

- 0 : GPRS
- 1 : circuit switched
- 2 : GPRS preferred. Use circuit switched if SMS via GPRS service not available or GPRS not registered.
- 3 : circuit switched preferred. Use GPRS if SMS via circuit switched not available.

i Entering **AT+CGSMS=** returns **OK** but has no effect.

AT+CGSMS?

The read command returns the currently selected service or service preference in the format:

+CGSMS: <service>

AT+CGSMS=?

Test command reports the supported list of currently available **<service>**.

The **<service>** value is saved on NVM as global parameter.

3.6.19. AT#SMSMODE - SMS Commands Operation Mode

SMS Commands Operation Mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SMSMODE=<mode>

Set command enables/disables the check for presence of SMS Service Centre Address (SCA) in the Fixed Dialing Number (FDN) phonebook.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 1 | Enables/disables the check for presence of SCA in FDN phonebook. |

Values:

- 1 : Disables the check for presence of SCA in FDN phonebook.
- 2 : Enables the check for presence of SMS SCA in the FDN phonebook when FDN are enabled. If the SMS SCA is not present a SMS cannot be sent.

AT#SMSMODE?

Read command reports whether the check of SMS SCA in FDN phonebook is enabled or not, in the format:

#SMSMODE: <mode>

AT#SMSMODE=?

Test command reports the range of <mode> parameter values.

3.6.20. AT#SMSRETRY - SMS Retry

Set command configures the total retry period and the retry interval to successfully send an SMS.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#SMSRETRY=<total_retry_period>[,<retry_interval>]

Parameters:

| Name | Type | Default | Description |
|-----------------------------------|---------|---------|---|
| <total_retry_period> | integer | 180 | indicates the total retry period in seconds |
| Value: | | | |
| 0÷255 : retry period in seconds | | | |
| <retry_interval> | integer | 45 | indicates the retry interval in seconds |
| Value: | | | |
| 0÷255 : retry interval in seconds | | | |

AT#SMSRETRY?

Read command returns the current parameters setting for **#SMSRETRY** command in the format:

#SMSRETRY: <total_retry_period>,<retry_interval>

AT#SMSRETRY=?

Test command reports the supported range of values for parameters

3.6.21. AT#CMGLCONCINDEX - Report Concatenated SMS Indexes

The command reports list of all concatenated SMS

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CMGLCONCINDEX

The command reports a line for each concatenated SMS containing:

#CMGLCONCINDEX: <N>,<i>,<j>,<k>,...

If no concatenated SMS is present on the SIM, only **OK** result code will be returned.

The parameters are described in the Additional info section.

Additional info:

- ▶▶ Here is the meaning of the parameters returned by the command.

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <N> | integer | - | Number of segments that form the whole concatenated SMS. |
| <i> | integer | - | index of the first SMS segment. 0 if segment has not been received. |
| <j> | integer | - | index of the second SMS segment. 0 if segment has not been received. |
| <k> | integer | - | index of the third SMS segment 0 if segment has not been received |
| <...> | integer | - | index of the next SMS segment ... |

 **AT#CMGLCONCINDEX=?**

Test command returns **OK** result code.

- Example of 2 concatenated SMS:
First composed by 3 segments: 1,2,3, but segment 0 not received yet.
Secondo composed by segments: 4,5,6,7,8, but segment 7 not received yet.

```
AT#CMGLCONCINDEX
```

```
#CMGLCONCINDEX: 3,0,2,3
```

```
#CMGLCONCINDEX: 5,4,5,6,0,8
```

```
OK
```

3.6.22. AT#E2SMSRI - SMS Ring Indicator

This set command enables/disables the Ring Indicator pin response to an incoming SMS message. If enabled, a negative going pulse is generated when receiving an incoming SMS message.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Required | Common profile | No | - | 2 |

AT#E2SMSRI=[<n>]

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------|
| <n> | integer | 0 | RI enabling |

Values:

- 0 : disables RI pin response for incoming SMS messages
- 50÷1150 : enables RI pin response for incoming SMS. The value of <n> is the duration in ms of the pulse generated on receipt of an incoming SMS.

-  If **+CNMI=3,1** command is issued, and the module is in a GPRS connection, a 100 ms break signal is sent and a 1 sec. pulse is generated on RI pin, no matter if the RI pin response is either enabled or not.

AT#E2SMSRI?

Read command reports the duration in ms of the pulse generated on receipt of an SMS, in the format:

#E2SMSRI: <n>

-  **<n>=0** means that the RI pin response to an incoming SMS is disabled

 **AT#E2SMSRI=?**

Reports the range of supported values for parameter **<n>**

3.6.23. AT#SMOV - SMS Overflow

The command is used to enable the SMS overflow signaling functionality.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#SMOV=[<mode>]

Set command enables the SMS overflow signaling function. If enabled, URC code is:

#SMOV: <memo>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|------------------------------|
| <mode> | integer | 0 | signaling functionality mode |

Values:

- 0 : disables SMS overflow signaling function
- 1 : enables SMS overflow signaling function

Unsolicited field:

| Name | Type | Description |
|--------|--------|---|
| <memo> | string | <memo> is a string indicating the SMS storage that has reached the maximum capacity |

Values:

- "SM" : SIM Memory
- "ME" : NVM SMS Storage

-  When the maximum storage capacity has been reached, if enabled, a network-initiated notification is sent.

**AT#SMOV?**

Read command reports whether the SMS overflow signaling function is currently enabled or not, in the format:

#SMOV: <mode>

**AT#SMOV=?**

Test command returns the supported range of values of parameter <mode>.

3.6.24. AT#SMSMOVE - Move Short Message to other Memory

This command moves selected Short Message from current memory to destination memory.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SMSMOVE=<index>

Execution command moves selected Short Message from current memory to destination memory.

Parameter:

| Name | Type | Default | Description |
|---------|--------|---------|--|
| <index> | string | - | message index in the memory selected by +CPMS command. It can have values form 1 to N, where N depends on the available space, see +CPMS . |

-  If the destination memory is full, an error is returned

AT#SMSMOVE?

Read command reports the message storage status of the current memory and the destination memory in the format:

```
#SMSMOVE:<curr_mem>,<used_curr_mem>,<total_curr_mem>,<dest_mem>,<used_dest_mem>,<total_dest_mem>
```

Additional info:

- ▶▶ Parameters:

| Name | Type | Default | Description |
|-----------------------------|---------|---------|---|
| <curr_mem> | string | N/A | current memory, selected by +CPMS command |
| Values: | | | |
| SM : SIM SMS memory storage | | | |
| ME : NVM SMS storage | | | |
| <used_curr_mem> | integer | - | number of SMS stored in the current memory |
| <total_curr_mem> | integer | - | max number of SMS that the current memory can contain |
| <dest_mem> | string | SM | destination memory |
| Values: | | | |
| SM : SIM memory | | | |
| ME : device memory | | | |
| <used_dest_mem> | integer | - | number of SMS stored in the destination memory |
| <total_dest_mem> | integer | - | max number of SMS that the destination memory can contain |

? AT#SMSMOVE=?

Test command reports the supported values for parameter <index>

AT#SMSMOVE?

#SMSMOVE: "ME",3,100,"SM",0,50

OK

The current memory is ME where 3 SMs are stored; the destination memory is SIM that is empty

AT+CMGL=ALL

+CMGL: 1,"STO UNSENT","32XXXXXXXX","",

Test 1

+CMGL: 2,"STO UNSENT","32XXXXXXXX","",

Test 2

+CMGL: 3,"STO UNSENT","32XXXXXXXX","",

Test 3

OK

List the SMs to discover the memory index

AT#SMSMOVE=1

OK

Move the SM in the first position of ME to SIM

AT#SMSMOVE?

#SMSMOVE: "ME",2,100,"SM",1,50

OK

Now we have 2 SMs in ME and 1 in SIM

3.7. Phonebook

3.7.1. AT+CPBS - Select Phonebook Memory Storage

This set command selects phonebook memory storage, which will be used by other phonebook commands.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CPBS=<storage>[,<password>]

Parameters:

| Name | Type | Default | Description |
|------------------------|--------|---------|--------------------------------------|
| <storage> | string | "SM" | specify the phonebook memory storage |

Values:

"SM" : SIM phonebook

"FD" : SIM fixed dialing-phonebook (FDN)(only phase 2/2+ SIM)

"LD" : SIM last-dialing-phonebook (+CPBF is not applicable for this storage)

"MC" : device missed (unanswered received) calls list (+CPBF is not applicable for this storage)

"RC" : ME received calls list (+CPBF is not applicable for this storage)

- "MB" : mailbox numbers stored on SIM; it is possible to select this storage only if the mailbox service is provided by the SIM (see #MBN)
- "DC" : ME last-dialing-phonebook (+CPBF is not applicable for this storage)
- "ME" : ME phonebook
- "EN" : SIM emergency numbers phonebook (+CPBW and +CPBF not applicable for this storage)
- "ON" : SIM own numbers (MSISDNs) phonebook (+CPBF is not applicable for this storage)
- "SD" : SIM Service Dialing Numbers (SDN) phonebook (+CPBW is not applicable for this storage)

<password> string - string type value representing the PIN2-code required when selecting PIN2-code locked **<storage>** above "FD".
if **<password>** parameter is given, PIN2 will be verified, even if it is not required, i.e. PIN2 is verified even if it has already been inserted and verified during current session.

- i** If "SM" is the currently selected phonebook, selecting "FD" phonebook with **AT+CPBS="FD"** command simply selects the FDN as the phonebook upon which all subsequent **+CPBW**, **+CPBF** and **+CPBR** commands act.

The command does not deactivate "SM" phonebook, and does not activate FDN.

AT+CPBS?

Read command returns the actual values of the parameter **<storage>**, the number of occupied records **<used>** and the maximum index number **<total>**, in the format:

+CPBS: <storage>,<used>,<total>

- i** For <storage>="MC": if there are more than one missed calls from the same number the read command will return only the last call.

? AT+CPBS=?

Test command returns the supported range of values for the parameter <storage>

3.7.2. AT+CPBR - Read Phonebook Entries

The command reads phonebook entries.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CPBR=<index1>[,<index2>]

Execution command returns phonebook entries in location number range <index1>..<index2> from the current phonebook memory storage selected with +CPBS. If <index2> is omitted, only location <index1> is returned.

The intermediate response format is:

```
[+CPBR:<index1>,<number>,<type>,<text>[,<hidden>][,<group>]
[,<adnumber>][,<adtype>][,<secondtext>][,<email>]]
```

...

```
[<CR><LF> +CPBR:<index2>,<number>,<type>,<text>[,<hidden>]
[,<group>][,<adnumber>] [,<adtype>][,<secondtext>][,<email>]]]
```

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <index1> | integer | - | value in the range of location numbers of the currently selected phonebook memory storage (see +CPBS). |
| <index2> | integer | - | value in the range of location numbers of the currently selected phonebook memory storage (see +CPBS). |

Additional info:

►► Intermediate response parameters

| Name | Type | Default | Description |
|--------------|---------|---------|---|
| <indexn> | integer | - | the location number of the phonebook entry |
| <number> | string | - | phone number of format <type> |
| <type> | integer | N/A | type of phone number octet Values: 129 : national numbering scheme 145 : international numbering scheme (contains the character "+") |
| <test> | string | - | the alphanumeric text associated to the number; character set as specified by command Select TE Character Set +CSCS |
| <hidden> | integer | 0 | indicates if the entry is hidden or not Values: 0 : phonebook entry not hidden 1 : phonebook entry hidden |
| <group> | string | - | the group the entry may belong to; character set as specified by command Select TE Character Set +CSCS |
| <adnumber> | string | - | additional phone number of format <adtype> |
| <adtype> | integer | - | type of address octet |
| <secondtext> | string | - | second text field associated with the number; character set |

| | | | |
|----------------------|--------|---|---|
| | | | as specified by command Select TE Character Set +CSCS |
| <email> | string | - | email address; character set as specified by command Select TE Character Set +CSCS |

- i** If "MC" is the currently selected phonebook memory storage, a sequence of missed calls coming from the same number will be saved as one missed call and **+CPBR** will show just one line of information.
- i** If all queried locations are empty (but available), no information text lines will be returned, while if listing fails in an ME error, **+CME ERROR: <err>** is returned.

AT+CPBR=?

Test command returns the supported range of values for parameters **<indexn>** and the maximum lengths of **<number>**, **<text>**, **<group>**, **<secondtext>** and **<email>** string parameters, in the format:

+CPBR: (<minIndex> - <maxIndex>),<nlength>,<tlength>,<glength>,<slength>,<elength>

Additional info:

- ▶▶ Test command response parameters

| Name | Type | Default | Description |
|-------------------------|---------|---------|--|
| <minIndex> | integer | - | the minimum <index> number |
| <maxIndex> | integer | - | the maximum <index> number |
| <nlength> | integer | - | maximum <number> field length |
| <tlength> | integer | - | maximum <name> field length |

| | | | |
|-----------|---------|---|-----------------------------------|
| <glength> | integer | - | maximum <group> field length |
| <slength> | integer | - | maximum <secondtext> field length |
| <elength> | integer | - | maximum <email> field length |

- i** The value of <nlength> could vary, depending on the availability of Extension service, in the following situations:
1. if "SM" memory storage has been selected (see **+CPBS**) and the SIM supports the Extension1 service
 2. if "FD" memory storage has been selected (see **+CPBS**) and the SIM supports the Extension2 service
 3. if "MB" memory storage has been selected (see **+CPBS**) and the SIM supports the Extension6 service

- i** Remember to select the PB storage with **+CPBS** command before issuing PB commands.

3.7.3. AT+CPBF - Find Phonebook Entries

This command returns phonebook entries.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT+CPBF=<findtext>

Execution command returns phonebook entries (from the current phonebook memory storage selected with +CPBS) which alphanumeric field start with string <findtext>.

Parameter:

| Name | Type | Default | Description |
|------------|--------|---------|--|
| <findtext> | string | - | string to be searched among the phonebook entries; used character set should be the one selected with command +CSCS. |

Additional info:

►►The command returns a report in the form:

```
[+CPBF:<index1>,<number>,<type>,<text>[,<hidden>][,<group>][,<adnumber>]
[,<adtype>][,<secondtext>][,<email>]<CR><LF>
+CPBF:<index2>,<number>,<type>,<text>[,<hidden>][,<group>][,<adnumber>]
[,<adtype>][,<secondtext>][,<email>][...]]
```

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <indexn> | integer | - | The location number of the phonebook entry |

| | | | |
|---------------------------|---------|-----|--|
| <number> | string | - | Phone number of format <type> |
| <type> | integer | N/A | type of phone number octet |
| | Values: | | |
| | 129 | : | national numbering scheme |
| | 145 | : | international numbering scheme (contains the character "+") |
| <text> | string | - | The alphanumeric text associated to the number; the character set used should be the one selected with command +CSCS |
| <group> | string | - | Field of maximum length <glength> indicating a group the entry may belong to; character set as specified by command Select TE Character Set +CSCS |
| <adnumber> | string | - | additional number; phone number of format <adtype> |
| <adtype> | integer | - | type of address octet |
| <secondtext> | string | - | Field of maximum length <slength> indicating a second text field associated with the number; character set as specified by command Select TE Character Set +CSCS |
| <email> | string | - | field of maximum length <elength> indicating an email address; character set as specified by command Select TE Character Set +CSCS |
| <hidden> | string | N/A | indicates if the entry is hidden or not |
| | Values: | | |
| | 0 | : | phonebook entry not hidden |
| | 1 | : | phonebook entry hidden |

- ❗ **+CPBF** is not applicable if the current selected storage (see **+CPBS**) is either "MC", "RC" or "LD".
- ❗ If **<findtext>=""** the command returns all the phonebook records.
- ❗ If no PB records satisfy the search criteria then an **ERROR** message is reported.

?🔍 AT+CPBF=?

Test command reports the maximum lengths of **<number>** and **<text>** fields, in the format:

+CPBF: <nlength>,<tlength>,<glength>,<slength>,<elength>

Additional info:

- ▶▶ Test command response fields

| Name | Type | Default | Description |
|------------------------|---------|---------|---|
| <nlength> | integer | - | Maximum length of field <number> |
| <tlength> | integer | - | Maximum length of field <text> |
| <glength> | integer | - | Maximum length of field <group> |
| <slength> | integer | - | Maximum length of field <secondtext> |
| <elength> | integer | - | Maximum length of field <email> |

-
- i** The value of **<nlength>** could vary, depending on the availability of Extension service, in the following situations:
1. if "SM" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension1** service
 2. if "FD" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension2** service
 3. if "MB" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension6** service
-

- i** Remember to select the PB storage with **+CPBS** command before issuing PB commands.

3.7.4. AT+CPBW - Write Phonebook Entry

This command writes phonebook entry in the current phonebook memory.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

 **AT+CPBW=[<index>],[<number>,[<type>],[<text>],[<group>],[<adnumber>],[<adtype>],[<secondtext>],[<email>],[<hidden>]]]]]]]]]]]**

Execution command writes phonebook entry in location number <index> in the current phonebook memory storage selected with +CPBS.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|--|
| <index> | integer | - | value in the range of location numbers of the currently selected phonebook memory storage (see +CPBS) |
| <number> | string | - | phone number in the format <type> |
| <type> | integer | 129 | type of number |
| Values: | | | |
| 129 : national numbering scheme | | | |
| 145 : international numbering scheme (contains the character "+") | | | |
| <text> | string | - | text associated to the number; used character set should be the one selected with command +CSCS |
| <group> | string | - | string type field of maximum length <glength> indicating a group the entry may belong to; character set as |

| | | | |
|--------------------------------|---------|---|--|
| | | | specified by command Select TE Character Set +CSCS |
| <adnumber> | string | - | additional number; string type phone number of format <adtype> |
| <adtype> | integer | - | type of address octet |
| <secondtext> | string | - | string type field of maximum length <slength> indicating a second text field associated with the number; character set as specified by command Select TE Character Set +CSCS |
| <email> | string | - | field of maximum length <elength> indicating an email address; character set as specified by command Select TE Character Set +CSCS |
| <hidden> | integer | 0 | indicates if the entry is hidden or not |
| Values: | | | |
| 0 : phonebook entry not hidden | | | |
| 1 : phonebook entry hidden | | | |

- i** If record number **<index>** already exists, it will be overwritten.
- i** If either **<number>**, **<type>** and **<text>** are omitted, the phonebook entry in location **<index>** is deleted.
- i** If either "LD", "MC" or "RC" memory storage has been selected (see **+CPBS**) it is possible just to delete the phonebook entry in location **<index>**, therefore parameters **<number>**, **<type>** and **<text>** must be omitted.
- i** Before defining **<group>** string, it is recommended to check, with **#CPBGR** command, the predefined group names, that could be already stored in USIM in Grouping information Alpha String (GAS) file. If all records in such file are already occupied, **+CPBW** command will return ERROR when trying to use a new group name that is not in the predefined GAS names. To define a new custom group string, it is necessary to

overwrite with it one of the old predefined strings, using **#CPBGW** command.

? AT+CPBW=?

Test command returns location range supported by the current storage as a compound value, the maximum length of **<number>** field, supported number format of the storage and maximum length of **<text>** field. The format is:

+CPBW: (list of supported **<index>s**),**<nlength>**,(list of supported **<type>s**),**<tlength>**, **<glength>**,**<slength>**,**<elength>**

Additional info:

- ▶▶ Test command response fields

| Name | Type | Default | Description |
|------------------------|---------|---------|---|
| <nlength> | integer | - | Maximum length of field <number> |
| <tlength> | integer | - | Maximum length of field <text> |
| <glength> | integer | - | Maximum length of field <group> |
| <slength> | integer | - | Maximum length of field <secondtext> |
| <elength> | integer | - | Maximum length of field <email> |

- i** the value of **<nlength>** could vary, depending on the availability of Extension service, in the following situations:
 1. if "SM" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension1** service
 2. if "FD" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension2** service
 3. if "MB" memory storage has been selected (see **+CPBS**) and the SIM supports the **Extension6** service

Remember to select the PB storage with **+CPBS** command before issuing PB commands.

if **<index>** is omitted or **<index>=0**, the number **<number>** is stored in the first free phonebook location.

```
AT+CPBW=0,"+39040X192YZ1",129,"Text"
```

```
AT+CPBW=,"+39040X192YZ1",129,"Text"
```

3.7.5. AT#CPBGR - Read Group Entries

This command returns Grouping information Alpha String (GAS) USIM file entries.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CPBGR=<indexFirst>[,<indexLast>]

Set command returns Grouping information Alpha String (GAS) USIM file entries in location number range <indexFirst>...<indexLast>. If <indexLast> is omitted, only location <indexFirst> is returned. The response, for each location, is a string. This string is a name used for a group the ADN entries can belong to.

The response format is:

```
[#CPBGR: <index1>,<text1>[<CR><LF>
#CPBGR: <index2>,<text2>[...]]]
```

Parameters:

| Name | Type | Default | Description |
|--------------|---------|---------|---------------------------|
| <indexFirst> | integer | NA | first location to be read |

Value:

minIndex=maxIndex : range of location numbers of GAS, where "minIndex" and "maxIndex" can be obtained by issuing the test command

| | | | |
|-------------|---------|----|--------------------------|
| <indexLast> | integer | NA | last location to be read |
|-------------|---------|----|--------------------------|

Value:

minIndex=maxIndex : range of location numbers of GAS, where "minIndex" and

"maxIndex" can be obtained by issuing the test command

Additional info:

▶▶ Response parameters:

| Name | Type | Default | Description |
|--|---------|---------|---|
| <index> | integer | N/A | location number of the GAS entry |
| Value: | | | |
| indexFirst÷indexLast : range of location numbers of GAS returned in the response | | | |
| <text> | string | - | alphanumeric text associated to the entry |

? AT#CPBGR=?

Test command returns the supported values of the parameters <index_n> and the maximum length of <text_n> field, in the format:

#CPBGR: (<minIndex> - <maxIndex>),<tlength>

Additional info:

▶▶ Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|-----------------------------|
| <minIndex> | integer | - | minimum <index> number |
| <maxIndex> | integer | - | maximum <index> number |
| <tlength> | integer | - | maximum <text> field length |

3.7.6. AT#CPBGW - Write Group Entry

Set command writes the name of a phonebook group <text> in the Grouping information Alpha String (GAS) USIM file in a specified location number <index>.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CPBGW=<index>,<text>

Parameters:

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <index> | integer | - | number of the record in the GAS file to be written; value ranges from 1 to the number of records of the GAS file, that varies from USIM to USIM |
| <text> | string | - | text to be stored in the record |

 If record number <index> already exists, it will be overwritten

AT#CPBGW=?

Test command returns location range supported by the current storage as a compound value, and maximum length of <text> field. The format is:

+CPBGW: (list of supported <index>s),<tlength>

Additional info:

▶▶ Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|------------------------|---------|---|--|
| <tlength> | integer | - | maximum length of field <text> in bytes; actual maximum number of characters that can be stored depends upon <text> coding (see +CSCS) |
|------------------------|---------|---|--|

3.7.7. AT#CPBD - Delete All Phonebook Entries

This command deletes all phonebook entries.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#CPBD

This execution command deletes all phonebook entries in the current phonebook memory storage selected with **+CPBS**.

AT#CPBD=?

Test command returns **OK** result code.

3.8. Time & Alarm

3.8.1. AT+CCLK - Clock Management

The command is related to real time clock management.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CCLK=<time>

Set command sets the real-time clock of the module.

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|--|
| <time> | string | N/A | Current time as quoted string in the format: "yy/MM/dd,hh:mm:ss±zz" |

Values:

- yy : year (two last digits are mandatory), range is 00..99
- MM : month (two digits are mandatory), range is 01..12
- dd : day (two digits are mandatory) The range for dd(day) depends either on the month and on the year it refers to. Available ranges are: (01..28) (01..29) (01..30) (01..31). Trying to enter an out of range value will raise an ERROR message.
- hh : hour (two digits are mandatory), range is 00..23
- mm : minute (two digits are mandatory), range is 00..59

ss : seconds (two digits are mandatory), range is 00..59

±zz : time zone (indicates the difference, expressed in quarter of an hour, between the local time and GMT; two digits are mandatory), range is -96...+96

AT+CCLK?

Read command returns the current setting **<time>** of the real-time clock, in the format:

+CCLK: <time>

- i** The three last characters of **<time>**, i.e. the time zone information, are returned by **AT+CCLK?** only if the **#NITZ** URC *'extended'* format has been enabled (see **#NITZ**).
-

AT+CCLK=?

Test command returns the **OK** result code.

Set date and time:

```
AT+CCLK="02/09/07,22:30:00+00"
```

```
OK
```

Read date and time:

```
AT+CCLK?
```

```
+CCLK: "02/09/07,22:30:25"
```

```
OK
```

3.8.2. AT+CALA - Alarm Management

This command is related to the alarm management.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CALA=<time>[,<n>[,<type>[,<text>[,<recurr>[,<silent>]]]]]

Set command stores in the internal Real Time Clock of the module an alarm time with respective settings.

It is possible to set up a recurrent alarm for one or more days in the week.

4. Currently just one alarm can be set.
5. Alarms are not supported after disconnecting from power. Coin cell are supported. In case of a power cut, alarm will be deleted and needs to be re-set.

When the RTC time reaches the alarm time then the alarm starts, the behavior of the module depends on the setting **<type>** and if the module was already ON at the moment when the alarm time had come.

Parameters:

| Name | Type | Default | Description |
|---------------------|--------|---------|---|
| <time> | string | - | current alarm time as quoted string in the format: "yy/MM/dd,hh:mm:ss±zz" Refer to +CCLK for the string meaning. Empty string (+CALA="") deletes the current alarm and resets all the +CALA |

| | | | |
|-----------------------|---------|-----|---|
| | | | parameters to the factory default configuration. "hh:mm:ss±zz" string must be used only when issuing +CALA with parameter <recurr> . |
| <n> | integer | 0 | index of the alarm |
| | Value: | | 0 : the only value supported |
| <type> | integer | 1 | alarm behavior type |
| | Values: | | 0 : reserved |
| | | 1 | : the module wakes up fully operative as if the ON/OFF button has been pressed. If the module is already ON when the alarm times out, then it does nothing. |
| | | 2÷8 | : see Additional info section. |
| <text> | string | - | alarm code text string used in the URC +CALA . It has meaning only if <type> is equal to 2, 5 or 6. |
| <recurr> | string | N/A | sets a recurrent alarm for one or more days in the week in the following format: " <1..7>[,<1..7>[, ...]] " |
| | Values: | | 0 : all days in the week |
| | | 1 | : Monday |
| | | 2 | : Tuesday |
| | | 3 | : Wednesday |
| | | 4 | : Thursday |

- 5 : Friday
- 6 : Saturday
- 7 : Sunday

<silent> integer N/A indicates if the alarm is silent or not

Values:

- 0 : the alarm is not silent
 - 1 : the alarm is silent
-

Additional info:

▶▶ **<type>=2**

The module wakes up in "alarm mode" if at the alarm time it was powered OFF, otherwise it remains fully operative. In both cases the module issues an unsolicited code every 3 s:

+CALA: <text>

Where **<text>** is the **+CALA** optional parameter previously set.

The module keeps on sending the unsolicited code every 3 s until a **#WAKE** or **#SHDN** command is received or a 90 seconds timer expires. If the module is in "alarm mode" and it does not receive the **#WAKE** command within 90s then it shuts down.

▶▶ **<type>=3**

The module wakes up in "alarm mode" if at the alarm time it was powered OFF, otherwise it remains fully operative. In both cases the module starts playing the alarm tone on the selected path for the ringer (see command **#SRP**).

The module keeps on playing the alarm tone until a **#WAKE** or **#SHDN** command is received or a 90 s time-out occurs. If the device is in "alarm mode" and it does not receive the **#WAKE** command within 90s then it shuts down.

If alarm expires during a call alarm sound will stop when the call is disconnected.

- ▶▶ **<type>=4**

The module wakes up in "alarm mode" if at the alarm time it was off, otherwise it remains fully operative. In both cases the module brings the alarm pin high, provided that one has been set (using **#ALARMPIN** or **#GPIO**) and keeps it in this state until a **#WAKE** or **#SHDN** command is received or a 90 seconds timer expires. If the device is in "alarm mode" and it does not receive the **#WAKE** command within 90s then it shuts down.

- ▶▶ **<type>=5**

The module will make both the actions as for **<type>=2** and **<type>=3**.

- ▶▶ **<type>=6**

The module will make both the actions as for **<type>=2** and **<type>=4**.

- ▶▶ **<type>=7**

The module will make both the actions as for **<type>=3** and **<type>=4**.

- ▶▶ **<type>=8**

The module wakes up in "alarm mode" if at the alarm time it was off, otherwise it remains fully operative. In both cases the module sets high the RI output pin. The RI output pin remains high until next **#WAKE** issue or until a 90s timer expires. If the device is in "alarm mode" and it does not receive the **#WAKE** command within 90s. After that it shuts down.

-  The "alarm mode" is indicated by hardware pin CTS to the ON status and DSR to the OFF status, while the "power saving" status is indicated by a CTS - OFF, DSR - OFF and USB_VBUS - OFF status. The normal operating status is indicated by DSR - ON or USB_VBUS - ON status.

During the "alarm mode" the device will not make any network scan and will not register to any network and therefore is not able to dial or receive any call or SMS.

The only commands that can be issued to the module in this state are the **#WAKE** and **#SHDN**, every other command must not be issued during this state.

AT+CALA?

Read command returns the list of current active alarm settings in the device, in the following format:

[+CALA: <time>,<n>,<type>,<[text]>,<recurr>,<silent>]

Note: on READ command <time> does not include the time zone.

AT+CALA=?

Test command returns the list of supported index values, alarm types, maximum length of the text to be displayed in the URC **+CALA**, maximum length of <recurr> and supported <silent>s, in the format:

+CALA: (list of supported <n>s),(list of supported <type>s),<tlength>,<rlength>,(list of supported <silent>s)

Additional info:

- ▶▶ Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|------------------------|--------|---|---|
| <tlength> | string | - | maximum length of <text> parameter |
|------------------------|--------|---|---|

| | | | |
|------------------------|--------|---|---|
| <rlength> | string | - | maximum length of <recurr> parameter |
|------------------------|--------|---|---|

</> AT+CALA="02/09/07,23:30:00+00"
OK

3.8.3. AT+CAPD - Postpone Alarm

Set command postpones or dismisses a currently active alarm.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CAPD=[<sec>]

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-------|---------|---|--|
| <sec> | integer | 0 | time in seconds to postpone the alarm. |
|-------|---------|---|--|

Values:

0 : alarm is dismissed

1÷60 : postpone time

 Entering **AT+CAPS=** returns **OK** but has no effect.

AT+CAPD=?

Test command reports the supported range of values for parameter <sec>.

3.8.4. AT+CSDF - Setting Date Format

This command sets the date format of the date information presented to the user.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CSDF=[<mode>[,<auxmode>]]

This command sets the date format of the date information presented to the user, which is specified by use of the **<mode>** parameter. The **<mode>** affects the date format on the phone display and doesn't affect the date format of the AT command serial interface, so it has no effect on our device.

The command also sets the date format of the TE-TA interface, which is specified by use of the **<auxmode>** parameter (i.e., the **<auxmode>** affects the **<time>** of **+CCLK** and **+CALA**).

Parameters:

| Name | Type | Default | Description |
|---------------------|---------|---------|----------------------------|
| <mode> | integer | 1 | phone display data format. |

Values:

- 1 : DD-MMM-YYYY
- 2 : DD-MM-YY
- 3 : MM/DD/YY
- 4 : DD/MM/YY
- 5 : DD.MM.YY
- 6 : YYMMDD

7 : YY-MM-DD

<auxmode> integer 1 TE-TA interface data format.

Values:

1 : yy/MM/dd

2 : yyyy/MM/dd

- i** The **<time>** format of **+CCLK** and **+CALA** is:
 6. "yy/MM/dd, hh:mm:ss+zz" when **<auxmode>=1**
 7. "yyyy/MM/dd, hh:mm:ss+zz" when **<auxmode>=2**
 - i** If the parameters are omitted (**AT+CSDF=**), then this command sets the default value of **<mode>**.
-

AT+CSDF?

Read command reports the currently selected **<mode>** and **<auxmode>** in the format:

+CSDF: <mode>, <auxmode>

AT+CSDF=?

Test command reports the supported range of values for parameters **<mode>** and **<auxmode>**.

- AT+CSDF?
+CSDF: 1,1
OK

```
AT+CCLK?  
+CCLK: "00/01/02,03:42:08+00"  
OK
```

- AT+CSDF=1,2
OK

```
AT+CCLK?  
+CCLK: "2000/01/02,03:42:23+00"  
OK
```

3.8.5. AT+CTZR - Time Zone Reporting

This command enables and disables the time zone change event reporting.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CTZR=<onoff>

Set command permits to enable/disable the time zone change event reporting.

If the reporting is enabled and whenever the time zone is changed, the MT returns the unsolicited result code:

+CTZV: <tz>

Parameter:

| Name | Type | Default | Description |
|---------|--------|---------|--|
| <onoff> | string | 0 | enable/disable the time zone change event reporting. |

Values:

0 : Disable time zone change event reporting

1 : Enable time zone change event reporting

Unsolicited field:

| Name | Type | Description |
|------|--------|----------------|
| <tz> | string | New time zone. |

AT+CTZR?

Read command reports the currently selected <onoff> in the format:

+CTZR: <onoff>

AT+CTZR=?

Test command reports the supported range of values for parameter **<onoff>**

3.8.6. AT+CTZU - Automatic Time Zone Update

Set command enables/disables the automatic time zone update via NITZ.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CTZU=<onoff>

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <onoff> | integer | 0 | enables/disables the automatic time zone update via NITZ |

Values:

0 : disable

1 : enable

- i** The command **+CTZU** is the ETSI standard equivalent of Telit custom command **#NITZ** (for the date and time update functionality).
- i** Despite of the name, the command **+CTZU** enables automatic update of the date and time set by **+CCLK** command (not only time zone). This happens when a Network Identity and Time Zone (NITZ) message is sent by the network.
If the automatic date and time update functionality has been enabled by **+CTZU** or **#NITZ** (or both), NITZ message will cause a date and time update.

AT+CTZU?

Read command reports the current setting of <**onoff**> in the format:

+CTZU: <**onoff**>

AT+CTZU=?

Test command returns the supported values of parameter <**onoff**>.

3.8.7. AT#NITZ - Network Identity and Time Zone

This command handles Network Identity and Time Zone.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT#NITZ=[<val>[,<mode>]]

Set command enables/disables the automatic date/time updating and the Full Network Name applying. It enables also the **#NITZ** URC in the format:

#NITZ: <datetime>

and permits to change its format.

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <val> | integer | 7 | <p>identifies the functionalities to enable. The <val> parameter is a sum of integer values, where every value corresponds to a functionality:</p> <ul style="list-style-type: none"> 8. 1 - enables automatic date/time updating 9. 2 - enables Full Network Name applying 10. 4 - sets the #NITZ URC 'extended' format (see <datetime> below) 11. 8 - sets the #NITZ URC 'extended' format with Daylight Saving Time (DST) support (see <datetime> below) |

Values:

0 : disables every functionality

1÷15 : sum of integer values

<mode> integer 0 enables/disables the **#NITZ** URC

Values:

0 : disables the URC

1 : enables the URC

Unsolicited field:

| Name | Type | Description |
|-------------------------|--------|---|
| <datetime> | string | string format depends on parameter <val> |
| | | 12. "yy/MM/dd,hh:mm:ss" - ' <i>basic</i> ' format, if <val> is in (0..3) |
| | | 13. "yy/MM/dd,hh:mm:ss±zz" - ' <i>extended</i> ' format, if <val> is in (4..7) |
| | | 14. "yy/MM/dd,hh:mm:ss±zz,d" - ' <i>extended</i> ' format with DST support, if <val> is in (8..15) |

For the meaning of the **<datetime>** subfields, please check **+CCLK** and **#CCLK** commands

- i** If the DST information is not sent by the network, then the **<datetime>** parameter will have the format "yy/MM/dd,hh:mm:ss±zz".
- i** Date and time information can be sent by the network after GSM registration or after PS attach.

AT#NITZ?

Read command reports whether

15. automatic date/time updating
16. Full Network Name applying
17. **#NITZ** URC (as well as its format)

are currently enabled or not in the format:

#NITZ: <val>,<mode>

AT#NITZ=?

Test command returns supported values of parameters **<val>** and **<mode>**.

The command parameters are stored in two different profiles:

18. **<val>** must be valid for all AT instances, so its value is entered in Common profile (extended section).
19. **<mode>** must be valid only for the AT instance where it has been set, so its value is entered in Specific profile (extended section).

Use the **#W[<n>]** command to store the updated profiles in NVM.

3.8.8. AT#CCLK - Clock Management

The command is related to real time clock management.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#CCLK=<time>

Set command sets the real-time clock of the module.

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|--|
| <time> | string | N/A | Current time as quoted string in the format: "yy/MM/dd,hh:mm:ss±zz,d" |

Values:

- yy : year (two last digits are mandatory), range is 00..99
- MM : month (two digits are mandatory), range is 01..12
- dd : day (two digits are mandatory) The range for dd(day) depends either on the month and on the year, it refers to. Available ranges are: (01..28) (01..29) (01..30) (01..31). Trying to enter an out of range value will raise an ERROR message.
- hh : hour (two digits are mandatory), range is 00..23
- mm : minute (two digits are mandatory), range is 00..59
- ss : seconds (two digits are mandatory), range is 00..59
- ±zz : time zone (indicates the difference, expressed in quarter of an hour, between the local time and GMT; two digits are mandatory), range is: -96..+96

d : number of hours added to the local TZ because of Daylight Saving Time (summertime) adjustment; range is 0-2.

AT#CCLK?

Read command returns the current setting of the real-time clock, in the format **<time>**.

If the time is set by the network but the DST information is missing, or the time is set by **+CCLK** command, then the **<time>** format is:

"yy/MM/dd,hh:mm:ss±zz"

- i** If the time is set by the network but the Daylight-Saving Time (DST) information is missing, or the time is set by **+CCLK** command, then the **<time>** format is:

"yy/MM/dd,hh:mm:ss±zz"

AT#CCLK=?

Test command returns the **OK** result code.

Set command:

```
AT#CCLK="02/09/07,22:30:00+04,1"  
OK
```

Read command:

```
AT#CCLK?  
#CCLK: "02/09/07,22:30:25+04,1"  
OK
```

3.8.9. AT#CCLKMODE - Clock Mode

This command allows to enable the local time or the UTC time.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#CCLKMODE=<mode>

Set command enables the local time or the UTC time in **+CCLK** and **#CCLK** commands and in **#NITZ** URC

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------|
| <mode> | integer | 0 | Time and date mode |

Values:

- 0 : Local time + local time zone offset
- 1 : UTC time + local time zone offset

AT#CCLKMODE?

Read command reports whether the local time or the UTC time is enabled, in the format:

#CCLKMODE: <mode>

AT#CCLKMODE=?

Test command reports the supported range of values for parameter <mode>

Example of the two clock mode settings:

```
AT#CCLKMODE?  
#CCLKMODE: 0  
OK  
#NITZ: 13/03/05,15:20:33+04,0  
AT+CCLK?  
+CCLK: "13/03/05,15:20:37+04"  
OK  
AT#CCLKMODE=1  
OK  
AT+CCLK?  
+CCLK: "13/03/05,14:20:45+04"  
OK  
AT#CCLKMODE?  
#CCLKMODE: 1  
OK  
#NITZ: 13/03/05,14:20:53+04,0  
AT+CCLK?  
+CCLK: "13/03/05,14:20:55+04"  
OK  
AT#CCLKMODE=0  
OK  
AT+CCLK?  
+CCLK: "13/03/05,15:20:59+04"  
OK
```

3.8.10. AT#WAKE - Wake from Alarm Mode

Stop any alarm activity

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#WAKE=<opmode>

Execution command stops any eventually present alarm activity and, if the module is in alarm mode, it exits the alarm mode and enters the normal operating mode.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|----------------|
| <opmode> | integer | 0 | operating mode |

Value:

- 0 : normal operating mode; the module exits the alarm mode and enters the normal operating mode, any alarm activity is stopped (e.g. alarm tone playing) and an OK result code is returned.

-  If **#WAKE=0** command is issued after an alarm has been set with **+CALA** command, but before the alarm has expired, it will answer **OK** but have no effect.

AT#WAKE?

Read command returns the operating status of the device in the format:

#WAKE: <status>

where:

<status>

- 0 - normal operating mode
- 1 - alarm mode or normal operating mode with some alarm activity.

AT#WAKE=?

Test command returns **OK** result code.

-  The alarm mode is indicated by status ON of hardware pin CTS and by status ON of pin DSR; the power saving status is indicated by a CTS - OFF and DSR - OFF status; the normal operating status is indicated by DSR - ON.
-  During the alarm mode the device will not make any network scan and will not register to any network and therefore is not able to dial or receive any call or SM, the only commands that can be issued to the MODULE in this state are the **#WAKE** and **#SHDN**, every other command must not be issued during this state.

3.8.11. AT+CSTF - Setting Time Format

Set command sets the time format of the time information presented to the user, which is specified by use of the **<mode>** parameter.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT+CSTF=[<mode>]

Parameter:

| Name | Type | Default | Description |
|---------------------|---------|---------|---|
| <mode> | integer | 1 | <mode> affects the time format on the phone display and doesn't affect the time format of the AT command serial interface, so it not actually not used |

Values:

1 : [hh]:[mm] (24 hour clock)

2 : [hh]:[mm] (a.m./p.m.)

Entering **AT+CSTF=** returns **OK** but has no effect.

AT+CSTF?

Read command reports the currently selected **<mode>** in the format:

+CSTF: <mode>.

 **AT+CSTF=?**

Test command reports the supported range of values for parameter **<mode>**.

3.8.12. AT+CALD - Delete Alarm

This command deletes an alarm in the ME.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CALD=<n>

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-----|---------|-----|-------------|
| <n> | integer | N/A | alarm index |
|-----|---------|-----|-------------|

Value:

0 : alarm index

AT+CALD=?

Test command reports the range of supported values for <n> parameter.

3.9. Audio

3.9.1. Audio Basic Configuration

3.9.1.1. AT+CRSL - Ringer Sound Level

This command is used to select the incoming call ringer sound level of the device.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT+CRSL=<level>

Set command is used to select the incoming call ringer sound level of the device.

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|-----------------------------------|
| <level> | integer | 2 | Incoming call ringer sound level. |

Values:

0 : Level: Off

1 : Level: Low

2 : Level: Middle

3 : Level: High

4 : Level: Progressive

**AT+CRSL?**

Read command reports the current **<level>** setting of the call ringer in the format:

+CRSL: <level>

**AT+CRSL=?**

Test command reports **<level>** supported values as compound value.

+CRSL: (0-4)

**Modules supporting the command**

| | |
|----------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.9.1.2. AT+CLVL - Loudspeaker Volume Level

This command allows to set the volume of internal loudspeaker audio output.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT+CLVL=<level>

Set command is used to select the volume of the internal loudspeaker audio output of the device.

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|---------------------|
| <level> | integer | 4 | Loudspeaker volume. |

Value:

0÷max : max value can be read by issuing the Test command.

AT+CLVL?

Read command reports the current <level> setting of the loudspeaker volume in the format:

+CLVL: <level>

AT+CLVL=?

Test command returns the supported values of parameter <level>.

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

i The setting is saved using the **&W** command.

3.9.1.3. AT+CMUT - Microphone Mute Control

This command enables/disables the muting of the uplink audio line during a voice call.

- 3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT+CMUT=<n>

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <n> | integer | 0 | controls the muting of the uplink audio line |

Values:

- 0 : mute off, microphone active
- 1 : mute on, microphone muted

 Set command is operative only during a voice call and it returns ERROR in all other cases.

 **Warning:** the "Common profile" information contained in the "Setting saved" field of the table, placed above the command syntax, must be replaced with "NO".

AT+CMUT?

Read command reports whether the muting of the uplink audio line during a voice call is enabled or not, in the format:

+CMUT:<n>

AT+CMUT=?

Test command reports the supported values for <n> parameter.

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.9.1.4. AT#ACDB - Audio Configuration

Injection of Audio Configuration.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ACDB[=<mode>]

This execution command starts injection of Audio configuration (ACDB) into the device. Once command is issued, the device will print the "connect" reply and will wait for data to be received.

+++ sequence can be used for end of data transmission (which will result in OK response).

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|-------------|
| <mode> | integer | 0 | Inject mode |

Value:

- 0 : Cold mode Injection. Audio Configuration is injected into FLASH. In order to be effective a reboot is required

AT#ACDB=?

Test command returns OK result code

| Modules supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

3.9.1.5. AT#OAP - Open Audio Loop

This set command enables/disables the Open Audio Path.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#OAP=[<mode>]

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------------------|
| <mode> | integer | 0 | enables/disables the Open Audio Path |

Values:

0 : disable

1 : enable

AT#OAP?

Read command reports the current value of the parameter <mode> in the format:

#OAP: <mode>

AT#OAP=?

Test command returns the supported values of parameter <mode>.

| Modules Supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

- i** **#OAP** is intended for testing purposes only. Thus, care must be taken to ensure that during the command execution no other audio interacting commands are issued.

3.9.2. Embedded DTMF Decoder & TTY

3.9.2.1. AT#DTMF - Embedded DTMF Decoder Enabling

This command enables/disables the embedded DTMF decoder.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT#DTMF=<mode>

Set command enables/disables the embedded DTMF decoder.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | enables/disables the embedded DTMF decoder |

Values:

- 0 : disables DTMF decoder
- 1 : enables the embedded DTMF decoder with URC activation
- 2 : enables the embedded DTMF decoder without URC activation

Additional info:

▶▶ <mode>=1

The DTMF tone receiving is notified with an unsolicited message through AT interface in the following format:

#DTMFEV: x

Unsolicited field:

| Name | Type | Description |
|------|--------|-------------|
| <x> | string | DTMF digit |

AT#DTMF?

Read command returns the currently selected **<mode>** in the format:

#DTMF: <mode>

AT#DTMF=?

Test command returns the supported values of the parameter **<mode>**.

Modules supporting the command

| ME910G1- | WWV |
| ML865G1- | WW voice |

3.9.3. Digital Voice Interface

3.9.3.1. AT#DVI - Digital Voiceband Interface

Digital Voiceband Interface handling.

[1] Hardware User's Guide of the used module

[2] 3G/4G Digital Voice Interface Application Note, 80000NT10050A

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Not required | Common profile | No | - | 2 |

AT#DVI=<mode>[,<dviport>,<clockmode>]

Set command enables/disables the Digital Voiceband Interface. To have information about the pins used by the interface, refer to document [1]. See also document [2].

Parameters:

| Name | Type | Default | Description |
|-------------|---------|---|---|
| <mode> | integer | 0 | enables/disables the DVI |
| Values: | | | |
| 0 | : | disable DVI | |
| 1 | : | enable DVI: audio is forwarded to the DVI block | |
| <dviport> | integer | 2 | select DVI port |
| Value: | | | |
| 2 | : | DVI port, the only available. | |
| <clockmode> | integer | - | reserved for backward compatibility. Default value 1. |

Warning: the "Common profile" information contained in the "Setting saved" field of the table, placed above the command syntax, must be replaced with "NO".

AT#DVI?

Read command reports last setting, in the format:

#DVI: <mode>,<dviport>,<clockmode>

AT#DVI=?

Test command reports the range of supported values for parameters <mode>,<dviport> and <clockmode>.

Modules Supporting the command

| Modules Supporting the command | |
|--------------------------------|----------|
| ME310G1- | WWV |
| ME910G1- | WWV |
| ML865G1- | WW voice |

Configure DVI as master using the DVI Port #2 (the only available)

AT#DVI=1,2,1

OK

3.10. HW and Radio Control

3.10.1. AT#CBC - Battery and Charger Status

This command returns the current Battery and Charger state.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#CBC

Execution command returns the current Battery and Charger state. The response is in the format:

#CBC: <ChargerState>,<BatteryVoltage>

Additional info:

- ▶▶ The response has its fields described below.

| Name | Type | Default | Description |
|--|---------|---------|---|
| <ChargerState> | integer | 0 | Battery charger state |
| Values: | | | |
| 0 : charger not connected | | | |
| 1 : charger connected and charging | | | |
| 2 : charger connected and charge completed | | | |
| <BatteryVoltage> | integer | - | battery voltage in units of 10 mV: it is the real battery voltage only if charger is not connected; if the charger is connected |

this value depends on the
charger voltage

 **AT#CBC=?**

Test command returns the **OK** result code.

3.10.2. AT#TEMPCFG - Temperature Monitor Configuration

Set command sets the temperature zones shown in Note section. Use #TEMPMON command to get the current internal temperature of the module.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

➔ **AT#TEMPCFG=<etlz_clr>,<etlz>,<etlz_act_in>,<otlz_clr>,<otlz>,<otlz_act_in >,<otnz_clr>,<otnz>,<otnz_act_in>,<otuz_clr>,<otuz>,<otuz_act_in>,<etuz_clr>,<etuz>,<etuz_act_in>**

Parameters:

| Name | Type | Default | Description |
|---------------|---------|---------|---|
| <etlz_clr> | integer | - | extreme low zone temperature threshold clear. It has only one valid value: -273 °C. See note. |
| <etlz> | integer | - | extreme low zone temperature threshold. Default value -33 °C. |
| <etlz_act_in> | integer | - | extreme low zone action info. Default value 0. |
| <otlz_clr> | integer | - | operate low zone temperature threshold clear. Default value -35 °C. |
| <otlz> | integer | - | operate low zone temperature threshold. Default value -28 °C. |
| <otlz_act_in> | integer | - | operate low zone action info. Default value 0. |
| <otnz_clr> | integer | - | operate normal zone temperature threshold clear. Default value -30 °C. |
| <otnz> | integer | - | operate normal zone temperature threshold. Default value 95 °C. |
| <otnz_act_in> | integer | - | operate normal zone action info. Default value 0. |

| | | | |
|---------------|---------|---|---|
| <otuz_clr> | integer | - | operate up zone temperature threshold clear. Default value 93 °C. |
| <otuz> | integer | - | operate up zone temperature threshold. Default value 100 °C. |
| <otuz_act_in> | integer | - | operate up zone action info. Default value 3. |
| <etuz_clr> | integer | - | extreme up zone temperature threshold clear. Default value 98 °C. |
| <etuz> | integer | - | extreme up zone temperature threshold. It has only one valid value: 528 °C. See note. |
| <etuz_act_in> | integer | - | extreme up zone action info. Default value 3. |

- i** The temperature correctly set are saved in a configuration file in the module file system.
- i** **etlz_clr**: extreme low zone threshold clear is enforced to have value of -273 °C. Module doesn't operate in such temperature, but this value is logically set to define clearly 'thermal state' to temperatures below -40 °C.
- i** **etuz**: extreme up zone threshold is enforced to have value of 528 °C. Module doesn't operate in such temperature, but this value is logically set to define clearly 'thermal state' to temperatures above 100 °C.
- i** The user must not set <otnz_act_in>=5 (**Operate normal zone**). This comes to prevent setting "automatic shutdown" by mistake to the normal operating temperature range. Error will be received as a response:

+CME ERROR: operation not supported

AT#TEMPCFG?

Read command reports the current parameter setting for #TEMPCFG command in the format:

#TEMPCFG:<etlz_clr>,<etlz>,<etlz_act_in>,<otlz_clr>,<otlz>,<otlz_act_in>,<otnz_clr>,<otnz>,<otnz_act_in>,<otuz_clr>,<otuz>,<otuz_act_in>,<etuz_clr>,<etuz>,<etuz_act_in>

?  AT#TEMPCFG=?

Test command reports the supported range values for parameters <x_clr>,<x>,<x_act_in>, where "x" is substitute for **etlz**, **otlz**, **otnz**, **otuz**, **etuz**.

Values are:

#TEMPCFG: (-40-100),(-40-100),(0-5)

Thermal mitigation mechanism

After setting new values, the mitigation algorithm operates with them if a power cycle or a **#REBOOT** command is executed. Thermal mitigation mechanism works like this:

20. the whole temperature scale is divided into 5 states (zones).
21. each measured temperature should belong to a state called the **current state**.

Each state is defined by the following fields:

| | |
|----------------------|--|
| threshold | upper temperature boundary of the state. Values are in Celsius degrees. |
| threshold_clr | lower temperature boundary of the state. Values are in Celsius degrees. |
| action_in | indicator that indicates if an action should be taken or not in the current state . |

action_in can be **none** or **mitigate**, their values are shown in the table below.

| none | mitigate | mitigation action |
|------|----------|---|
| 0 | | no mitigation |
| | 1 | data throttling (reducing uplink baud rate) |
| | 2 | TX back off (reducing MTPL - Max Tx Power Limit) |
| | 3 | emergency calls only |
| | 4 | RF OFF. RX and TX circuits automatically disabled (using +CFUN=4) |
| | 5 | automatic shutdown. Module is powered OFF |

When temperature exceeds the **current state threshold**, the thermal mitigation algorithm searches the next state when this temperature is **lower** than **threshold**. After it finds it, the **current state** is updated to that **state** and then it checks whether **action** is **mitigate**. If yes, then it activates the mitigation according to the **action_in** of the **current state**.

When temperature decreases below **threshold_clr** then it does the same algorithm as above, but in the opposite direction. It searches the next state when this temperature is greater than **threshold_clr**, updates the **current state** to that state, and activates mitigation as described above.

In the state definitions there are the following two rules:

22. rule 1: overlap between 2 adjacent states of at least 2 °C, i.e.:
 $\text{thr of state}(x) - \text{thr_clr of state}(x+1) \geq 2$
23. rule 2: every state shall have free temperature range which has no part in any overlap range. This range should be at least 2 °C, i.e.:
 $\text{thre_clr state}(x+2) - \text{thre state}(x) \geq 2$

Rule 1 comes to ensure hysteresis in the transition between two states.

Rule 2 comes to ensure a minimum range for a stable state.

Referring to the figure below:

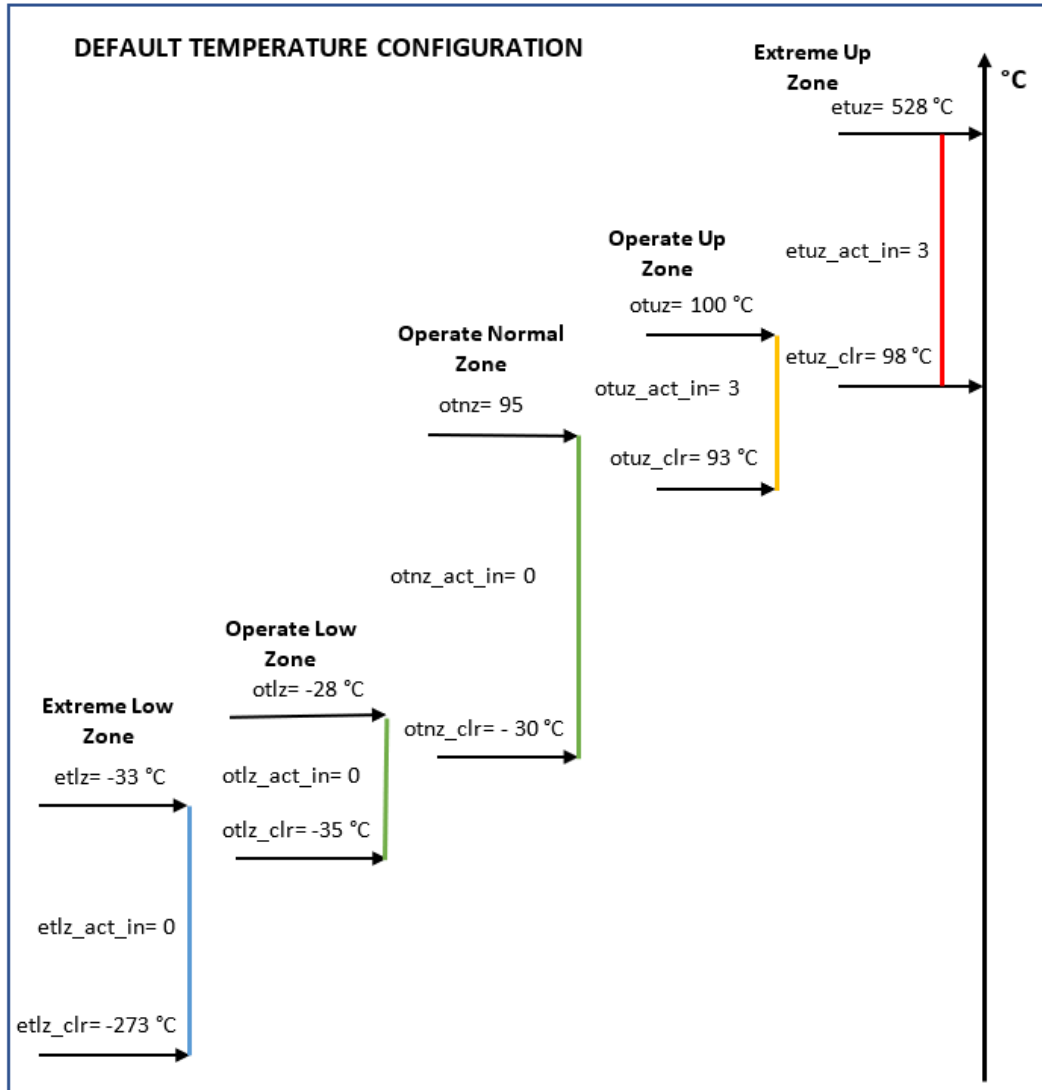

State 0 is **Extreme low zone**

State 1 is **Operate low zone**

State 2 is **Operate normal zone**

State 3 is **Operate up zone**

State 4 is **Extreme up zone**

- AT#TEMPCFG= -273,-33,3,-35,-28,2,-30,80,0,78,90,3,88,528,3
OK

Rules 1 and 2 are respected.

| zone | thr_clr | thr | action_in |
|---------------------|---------|-----|------------------------|
| Extreme low zone | -273 | -33 | 3: emergency call only |
| Operate low zone | -35 | -28 | 2: TX back off |
| Operate normal zone | -30 | 80 | 0: no mitigation |
| Operate up zone | 78 | 90 | 3: emergency call only |
| Extreme up zone | 88 | 528 | 3: emergency call only |

- AT#TEMPCFG=-273,-33,3,-35,-28,2,-30,**80**,0,**79**,90,3,88,528,3
+CME ERROR: operation not supported

Rule 1 is not respected:

(thr of Operate normal zone) - (thr_clr of Operate up zone) = 1 < 2

| zone | thr_clr | thr | action_in |
|---------------------|-----------|-----------|------------------------|
| Extreme low zone | -273 | -33 | 3: emergency call only |
| Operate low zone | -35 | -28 | 2: TX back off |
| Operate normal zone | -30 | 80 | 0: no mitigation |
| Operate up zone | 79 | 90 | 3: emergency call only |
| Extreme up zone | 88 | 528 | 3: emergency call only |

- AT#TEMPCFG=-273,-33,3,-35,-28,2,-30,**80**,0,78,90,3,**81**,528,3
+CME ERROR: operation not supported

Rule 2 is not respected:

(thr_clr of Extreme up zone) - (thr of Operate normal zone) = 1 < 2

| zone | thr_clr | thr | action_in |
|---------------------|---------|-----------|------------------------|
| Extreme low zone | -273 | -33 | 3: emergency call only |
| Operate low zone | -35 | -28 | 2: TX back off |
| Operate normal zone | -30 | 80 | 0: no mitigation |

| | | | |
|-----------------|-----------|-----|------------------------|
| Operate up zone | 78 | 90 | 3: emergency call only |
| Extreme up zone | 81 | 528 | 3: emergency call only |

3.10.3. AT#GPIO - General Purpose Input/Output Pin Control

Configure the general-purpose input/output GPIO pins.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT#GPIO=[<pin>,<mode>[,<dir>[,<save>]]]

Execution command allows to configure the general purpose GPIO pin.

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--|
| <pin> | integer | N/A | GPIO pin number. The supported range goes from 1 to Max value that is hardware dependent. Use AT#GPIO=? test command to know Max value. |
| Value: | | | |
| 1÷Max : GPIO pin identifier | | | |
| <mode> | integer | 0 | sets GPIO pin configuration, its action depends on <dir> value. Refer to Additional info sections. |
| Value: | | | |
| 0÷4 : mode identifier | | | |
| <dir> | integer | 0 | sets the GPIO pin in input, output, or alternate functions. Refer to Additional info sections. |
| Values: | | | |
| 0 : pin set as input | | | |
| 1 : pin set as output | | | |
| 2÷16 : pin set in alternate functions. | | | |

<save> integer 0 GPIO pin save configuration. If **<save>** is omitted, the configuration is stored in NVM only if user set ALTx function.

Values:

0 : GPIO pin configuration is not saved

1 : GPIO pin configuration is saved

Additional info:

- ▶▶ This table shows the GPIOs configurations set by **<dir>=0** and **<mode>** values ranging from 0 to 4.

AT#GPIO=<pin>,<mode>,0

| <mode> | Description |
|---------------------|--|
| 0 | Set INPUT, any internal pull up/pull down removed. |
| 1 | Set INPUT, any internal pull up/pull down removed (same behavior as <mode>=0). |
| 2 | Read mode, <dir> can be omitted, see Additional info section below |
| 3 | Set INPUT, and internal pull up. |
| 4 | Set INPUT, and internal pull down. |

- ▶▶ This table shows the GPIOs configurations set by **<dir>=1** and **<mode>** values ranging from 0 to 4.

AT#GPIO=<pin>,<mode>,1

| <mode> | Description |
|---------------------|---|
| 0 | Set OUTPUT, and GPIO logical value to zero (Low). |
| 1 | Set OUTPUT, and GPIO logical value to one (High). |
| 2 | Read mode, <dir> can be omitted, see Additional info section below |

| | |
|---|------------------------|
| 3 | <mode> has no meaning. |
| 4 | <mode> has no meaning. |

- ▶▶ <mode>=2 selects the read mode. In read mode, <dir> can be omitted.

AT#GPIO=<pin>,2

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <stat> | integer | - | the parameter can be: 24. logic value read from pin GPIO<pin> in the case the pin <dir> is set to input. 25. logic value present in output of the pin GPIO<pin> in the case the pin <dir> is currently set to output. 26. no meaning value for the pin GPIO<pin> in the case the pin <dir> is set to alternate function or tristate pull down. |

- ▶▶ <dir> values from 2 to 16 select an alternate function ranging respectively from ALT1 to ALT15. <mode> must be set to 0 or 1 when an alternate function is selected. The table shows the relationship between ALT_x, <dir> and the name of the associated function.

AT#GPIO=<pin>,0,<dir>

| ALT _x | Functions names (between quotes) associated to ALT _x |
|------------------|---|
|------------------|---|

| | |
|------------------|---|
| ALT1 (<dir>=2) | #GPIO maps "STAT_LED" on: GPIO_01 for ME910G1 family: AT#GPIO=1,0,2 GPIO_08 for ML865G1 family: AT#GPIO=8,0,2 see #SLED to configure the STAT_LED GPIO_x behavior. |
| ALT2 (<dir>=3) | #GPIO or #ALARMPIN maps "ALARM" on one of the available GPIOs. Example: AT#GPIO=<pin>,0,3 |
| ALT3 (<dir>=4) | #GPIO maps "TEMPMON" on one of the available GPIOs. Example: AT#GPIO=<pin>,0,4 |
| ALT4 (<dir>=5) | Reserved |
| ALT5 (<dir>=6) | Reserved |
| ALT6 (<dir>=7) | #GPIO maps "FASTSHDN" on one of the available GPIOs. Example: AT#GPIO=4,0,7 |
| ALT7 (<dir>=8) | Reserved |
| ALT8 (<dir>=9) | #GPIO maps "DTR" on GPIO_01 or GPIO_05 for ME310G1 family |
| ALT9 (<dir>=10) | #GPIO maps "RING" on GPIO_02 or GPIO_06 for ME310G1 family |
| ALT10 (<dir>=11) | #GPIO maps "SIMIN" on one of the available GPIOs for ME310G1 and ML865G1 families. The same function can be set through #SIMINCFG command. Example: AT#GPIO=5,0,11 |
| ALT11 (<dir>=12) | Reserved |
| ALT12 (<dir>=13) | #GPIO maps "Network Attach Indicator" on GPIO_03 for ME310G1 SKT |
| ALT13 (<dir>=14) | #GPIO maps "TX Packet Monitor" on GPIO_04 for ME310G1 SKT |
| ALT14 (<dir>=15) | #GPIO maps "RX Packet Monitor" on GPIO_05 for ME310G1 SKT |
| ALT15 (<dir>=16) | #GPIO maps "DCD" on one of the available GPIOs for ME310G1 family |

- i** ALT12: TGPIO_03 goes low when there is a CS or a PS attach, even in ROAMING, otherwise it is high.
- i** ALT14: GPIO_04 goes low as soon as a TX packet (PPP, ECM) is sent, and then it starts toggling high and low with 100 ms time as long as TX packets are sent. When there are no more packets to sent the pin goes back to high state.
- i** ALT15: GPIO_05 goes low as soon as a RX packet (PPP, ECM) is received, and then it starts toggling high and low with 100 ms time as long as RX packets are received. When there are no more packets to receive the pin goes back to high state.
- i** While using the pins in the alternate function, the GPIO read/write access to that pin is not accessible and must be avoided.

AT#GPIO?

Read command reports, for any GPIO pin, a row showing the current parameters values. Row one shows GPIO pin one, row two shows GPIO pin two, and so on.

```
#GPIO: <dir>,<stat><CR><LF>
```

```
#GPIO: <dir>,<stat><CR><LF>
```

...

If GPIO was previously set to **<mode>**= 3 or 4, the format of the returned message is:

```
#GPIO:<dir>,<stat>,<mode><CR><LF>
```

```
#GPIO:<dir>,<stat>,<mode><CR><LF>
```

...

AT#GPIO=?

Test command reports the supported range of values of the command parameters **<pin>**, **<mode>**, **<dir>**, and **<save>**.

Check the available values ranges

AT#GPIO=?

#GPIO: (1-6),(0-4),(0-16),(0,1)

OK

Set GPIO_3 in output, and set logical value HIGH

AT#GPIO=3,1,1

OK

Set GPIO_4 as output, value HIGH a save setting

AT#GPIO=4,1,1,1

#GPIO: 1,0

OK

Report GPIO_3 state

AT#GPIO=3,2

#GPIO: 1,1

OK

Read command

AT#GPIO?

#GPIO: 1,1 GPIO_1 is output, value is HIGH

#GPIO: 0,0

#GPIO: 1,1

#GPIO: 0,0

#GPIO: 0,1 GPIO_5 is input, value is HIGH

#GPIO: 1,0

OK

3.10.4. AT#ALARMPIN - Alarm Pin Configuration

This command allows to configure the ALARM Pin.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ALARMPIN=<pin>

Set command allows to set a GPIO pin as ALARM pin.

Configuring a GPIO pin as ALARM pin is equivalent to setting it up with the ALT2 alternate function. Therefore, a GPIO pin can be configured as ALARM pin also through the **#GPIO** command. To have information on GPIO pins refer to document [1].

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <pin> | integer | 0 | GPIO pin number. Max is the number of GPIO pins provided by the module. For information on the available GPIO pins use the test command. |

Values:

0 : no ALARM pin set

1÷Max : GPIO pin number

AT#ALARMPIN?

Read command returns the current value of the parameter <pin> in the format:

#ALARMPIN: <pin>

AT#ALARMPIN=?

Test command returns the supported values of parameter **<pin>**.

3.10.5. AT#SLED - STAT_LED GPIO Setting

The command configures the behavior of the STAT_LED status.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT#SLED=<mode>[,<onDuration>[,<offDuration>]]

STAT_LED is mapped on a GPIO for ME910G1 and ML865G1 families, but it is on a dedicated pin for ME310G1 family.

To configure a GPIO pin as STAT_LED GPIO, the user must enter **AT#GPIO=x,0,2** command to set the GPIO_x pin as ALT1 alternate function. At the next power ON, the GPIO pin is low until the control reads the saved setting in NVM and configures the GPIO_x as STAT_LED GPIO. Not all GPIOs can be configured as STAT_LED pin. See #GPIO description to know the available GPIOs for this function.

In case of a dedicated pin for STAT_LED function, there is no GPIO to set in ALT1 function.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <mode> | integer | N/A | defines the STAT_LED pin behavior. "pin" indicates the GPIO or the dedicated pin according to the family of modules used. |

| Family | <mode> default value |
|---------|----------------------|
| ME910G1 | 2 |
| ML865G1 | 2 |
| ME310G1 | 5 |

Values:

0 : pin tied low

- 1 : pin tied high
- 2 : pin is handled with specific timings. See Additional info section
- 3 : pin is turned ON/OFF alternatively, with period defined by the sum `<onDuration> + <offDuration>`
- 4 : pin is handled with specific timings. See Additional info section
- 5 : status led disabled

| | | | |
|---------------------------|---------|----|---|
| <onDuration> | integer | 10 | duration of period in which STAT_LED pin is tied high while <mode>=3 |
|---------------------------|---------|----|---|

Value:

1÷100 : in tenth of seconds

| | | | |
|----------------------------|---------|----|--|
| <offDuration> | integer | 10 | duration of period in which STAT_LED pin is tied low while <mode>=3 |
|----------------------------|---------|----|--|

Value:

1÷100 : in tenth of seconds

Additional info:

▶▶ **<mode>=2**, the timings of STAT_LED pin are:

- 27. not registered: always ON
- 28. registered in idle: blinking 1 s ON and 2 s OFF
- 29. registered in idle with power saving: blinking time depends on network condition to minimize power consumption
- 30. during a voice call: always ON

▶▶ **<mode>=4**, the timings of STAT_LED pin are:

31. not registered: blinking 0,5 s ON and 0,5 s OFF
32. registered in idle: blinking 300 ms ON and 2,7 s OFF
33. registered in idle with power saving: blinking time depends on network condition to minimize power consumption
34. during a voice call: always ON

AT#SLED?

Read command returns the STAT_LED pin current setting, in the format:
#SLED: <mode>,<onDuration>,<offDuration>

AT#SLED=?

Test command returns the range of available values for parameters
<mode>, **<onDuration>** and **<offDuration>**.

The setting is saved using the **#SLEDSAV** command.

3.10.6. AT#SLEDSAV - Save STAT_LED GPIO Setting

This command allows to save the current **STAT_LED** GPIO setting.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SLEDSAV

Execution command saves the **STAT_LED** GPIO setting in NVM.

AT#SLEDSAV=?

Test command returns **OK** result code.

3.10.7. AT#ADC - Read Analog/Digital Converter Input

This command returns the current voltage value of the specified ADC inputs, expressed in mV.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ADC=[<adc>,<mode>[,<dir>]]

Execution command reads selected **<adc>** pin voltage, converts it by baseband internal ADC and prints outs the result as shown in Additional info section.

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|---|
| <adc> | integer | 1 | index of input pin |
| Value: | | | |
| 1÷n : input pin index. For the number of available ADCs see document [1] | | | |
| <mode> | integer | 2 | required action |
| Value: | | | |
| 2 : query ADC value | | | |
| <dir> | integer | 0 | direction. Its interpretation is currently not implemented. |
| Value: | | | |

0 : no effect

Additional info:

- ▶▶ Format of the message printed out by the execution command:
#ADC:<value>

| Name | Type | Default | Description |
|-------|---------|---------|------------------------------|
| <adc> | integer | - | pin voltage expressed in mV. |

-  The command returns the last valid measure.

AT#ADC?

Read command reports all pins input voltage in the format:

#ADC:<value>[<CR><LF>#ADC:<value>[...]]

AT#ADC=?

Test command reports the supported range of values of the command parameters **<adc>**, **<mode>** and **<dir>**.

3.10.8. AT#V24CFG - V24 Output Pins Configuration

This command sets the AT commands serial port interface output pins mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#V24CFG=<pin>,<mode>

Set command sets the AT commands serial port interface output pins mode.

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|--|
| <pin> | integer | 0 | AT commands serial port interface hardware pin |

Values:

- 0 : DCD (Data Carrier Detect)
- 1 : CTS (Clear To Send)
- 2 : RI (Ring Indicator)
- 3 : DSR (Data Set Ready)

| | | | |
|--------|---------|---|--|
| <mode> | integer | 0 | AT commands serial port interface hardware pins mode |
|--------|---------|---|--|

Values:

- 0 : AT commands serial port mode: the V24 pins are controlled by the serial port device driver
- 1 : GPIO mode: the V24 output pins can be managed through the #V24 command

-  Changing V24 pins configuration may affect the cellular module functionality set through **+CFUN**.
-  After being set the CTS pin as output pin, its functionality as CTS can be restored only through a reboot

AT#V24CFG?

Read command returns the current configuration for all the pins (both output and input) in the format:

```
#V24CFG: <pin1>,<mode1>[<CR><LF><CR><LF>  
#V24CFG: <pin2>,<mode2>[...]]
```

AT#V24CFG=?

Test command reports supported range of values for parameters **<pin>**, and **<mode>**.

3.10.9. AT#V24 - V24 Output Pins Control

This command sets the state of the output pins of the AT commands serial port interface.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#V24=<pin>[,<state>]

Set command sets the AT commands serial port interface output pins state.

Parameters:

| Name | Type | Default | Description |
|-------------------------------|---------|---------|--|
| <pin> | integer | 0 | AT commands serial port interface hardware pin: |
| Values: | | | |
| 0 : DCD (Data Carrier Detect) | | | |
| 1 : CTS (Clear To Send) | | | |
| 2 : RI (Ring Indicator) | | | |
| 3 : DSR (Data Set Ready) | | | |
| <state> | integer | 0 | State of AT commands serial port interface output hardware pins (0, 1, 2, 3) when pins are in GPIO mode (see #V24CFG): |
| Values: | | | |
| 0 : Low state | | | |
| 1 : High state | | | |

-
-  If **<state>** is omitted the command returns the actual state of the pin **<pin>**.
-

AT#V24?

Read command returns actual state for all the available pins in the format:

```
#V24: <pin1>,<state1>[<CR><LF>
```

```
#V24: <pin2>,<state2>[...]]
```

AT#V24=?

Test command returns the supported values of parameters **<pin>** and **<state>**.

3.10.10. AT#I2CWR - Write to I2C

This command is used to send data to an I2C peripheral connected to module.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#I2CWR=<sdaPin>,<sclPin>,<deviceId>,<registerId>,<len>

Execution command sends data to an I2C peripheral connected to module GPIOs. After the writing activity has been accomplished, the GPIOs will not be restored to the original setting. Use **#GPIO** command to see the status of the used GPIOs. To have information on GPIO pins refer to document [1].

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|--|
| <sdaPin> | integer | - | GPIO number for SDA. To know the range use #I2CWR test command. |
| <sclPin> | integer | - | GPIO number for SCL. To know the range use #I2CWR test command. |
| <deviceId> | hex | N/A | address of the I2C device (7 bits). The Least Significant Bit is used for read/write command, but in this #I2CWR implementation, it doesn't matter if the LSB is set to 0 or 1. Address must be written in hexadecimal form without 0x. 10 bit address is also supported. |

Value:

0÷3FF : addressing range extended to 10 bit

| | | | |
|--------------|-----|-----|---------------------------|
| <registerId> | hex | N/A | register to write data to |
|--------------|-----|-----|---------------------------|

Value:

0÷FF : value must be written in hexadecimal form without 0x

| | | | |
|--------------------|---------|-----|------------------------|
| <len> | integer | N/A | number of data to send |
|--------------------|---------|-----|------------------------|

Value:

1÷254 : number of data to send

Additional info:

- ▶▶ After entering the command, the module returns the prompt ">" and waits for the data to send. To complete the operation, send **Ctrl-Z** char (**0x1A** hex); to exit without writing the message send **ESC** char (**0x1B** hex). Data must be written in hexadecimal form.

If data are successfully sent, the response is **OK**, otherwise an error code is reported.

? AT#I2CWR=?

Test command returns the range of available values for parameters <sdaPin>, <sclPin>, <deviceId>, <registerId>, <len>.

Set GPIO_2 as SDA, and GPIO_3 as SCL. Device I2C address is 0x20; 0x10 is the address of the first register where to write I2C data; 14 data bytes will be written starting from register 0x10.

```
AT#I2CWR=2,3,20,10,14
> 00112233445566778899AABBCCDD<ctrl-z>
OK
```

3.10.11. AT#I2CRD - Read from I2C

This command is used to read data from an I2C peripheral connected to module.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#I2CRD=<sdaPin>,<sclPin>,<devicId>,<registerId>,<len>

Execution command reads data from an I2C peripheral connected to module GPIOs. After the reading activity has been accomplished, the GPIOs will not be restored to the original setting. Use **#GPIO** command to see the status of the used GPIOs. To have information on GPIO pins refer to document [1].

Parameters:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <sdaPin> | integer | - | GPIO number for SDA. To know the range use #I2CRD test command. |
| <sclPin> | integer | - | GPIO number for SCL. To know the range use #I2CRD test command. |
| <devicId> | hex | N/A | address of the I2C device (7 bits). The Least Significant Bit is used for read/write command, but in this #I2CCF implementation, it doesn't matter if the LSB is set to 0 or 1. Address must be written in hexadecimal form without 0x. 10 bit address is also supported |

Value:

0÷3FF : addressing range extended to 10 bit

| | | | |
|---------------------------|---|-----|----------------------------|
| <registerId> | hex | N/A | Register to read data from |
| | Value: | | |
| | 0÷FE : value must be written in hexadecimal form without 0x | | |

| | | | |
|--------------------|-----------------------------------|-----|---|
| <len> | integer | N/A | Number of data to receive |
| | | | 35. Data Read from I2C will be dumped in hexadecimal format |
| | | | 36. If data requested are more than data available in the device, dummy data (normally 0x00 or 0xff) will be dumped |
| | Value: | | |
| | 1÷254 : number of data to receive | | |

**AT#I2CRD=?**

Test command returns the range of available values for parameters **<sdaPin>**, **<sclPin>**, **<deviceId>**, **<registerId>**, **<len>**.

Read 12 bytes from I2C device with address 0x20, starting from register address 0x10. SDA is mapped on GPIO_02, SCL is mapped on GPIO_03.

```
AT#I2CRD=2,3,20,10,12
#I2CRD: 00112233445566778899AABBCC
OK
```

3.10.12. AT#I2CCF - Combined Format for I2C Writing and Reading

This command is used to write and read data to/from an I2C device using the I2C Combined Format. The module acts as an I2C master.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#I2CCF=<sdaPin>,<sclPin>,<deviceld>,<lenwr>,<lenrd>

The module, as master, transmits data to the slave and then, reads data from it through two GPIOs. Transfer direction is changed when writing section is ended. After the write/read activity has been accomplished, the GPIOs will not be restored to the original setting. Use **#GPIO** command to see the status of the used GPIOs. To have information on GPIO pins refer to document [1].

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <sdaPin> | integer | - | GPIO number for SDA. To know the range use #I2CCF test command. |
| <sclPin> | integer | - | GPIO number for SCL. To know the range use #I2CCF test command. |
| <deviceld> | hex | N/A | address of the I2C device (7 bits). The Least Significant Bit is used for read/write command, but in this #I2CCF implementation, it doesn't matter if the LSB is set to 0 or to 1. Address must be written in hexadecimal form without 0x. 10 bit address is also supported. |

Value:

0÷3FF : addressing range extended to 10 bit

<lenwr> integer N/A number of data to write.

Value:

0÷254 : number of data to write.

<lenrd> integer N/A number of data to read.

Value:

0÷254 : number of data to read.

Additional info:

- ▶▶ After entering the command, and if <lenwr> > 0, the module returns the prompt ">" and waits for the data to send. To complete the operation enter **Ctrl-Z** char (**0x1A** hex); to exit without writing the message enter **ESC** char (**0x1B** hex).

Data must be written in hexadecimal form without 0x.

If data are successfully sent, the response is **OK**, otherwise an error code is reported.

AT#I2CCF=?

Test command returns the range of available values for parameters <sdaPin>, <sclPin>, <devicId>, <lenwr>, <lenrd>.

- Set GPIO_2 as SDA, GPIO_3 as SCL; Device I2C address is 0x20; First is send data 0x0a; after a "RESTART", 4 data bytes are read.

```
AT#I2CCF=2,3,20,1,4
>0a<ctrl-z>
#I2CCF: abcdef12
OK
```

The sequence is the following:

START - 0x20- 0x0a -RESTART - 0x21 - data read 1 -...- data read 4 - STOP

- Set GPIO_2 as SDA, GPIO_3 as SCL; Device I2C address is 0x20; read data:

```
AT#I2CCF=2,3,20,0,2
#I2CCF: abcd
OK
```

The sequence is the following:

START - 0x21- - data read 1 - data read 2 - STOP

3.10.13. AT#TEMPMON - Temperature Monitor

This command is used to retrieve internal temperature information of the module.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#TEMPMON=<mod>[,<urcMode>[,<action>[,<hystTime>[,<GPIO>]]]]

Set command sets the internal temperature monitoring mode of the module, reads it, and enables/disables/triggers the presentation of the temperature monitoring message, that can be respectively an URC or an intermediate message according to the selected mode.

#TEMPMEAS: <level>,<value>

The temperature monitoring message parameters are described in the Unsolicited fields section.

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <mod> | integer | 0 | select the temperature monitoring mode. |

Values:

- 0 : only if <mod>=0 optional parameters of the command have meaning
- 1 : triggers the measurement of the module internal temperature, reporting the result using the format shown above

| | | | |
|-----------|---------|---|-----------------------|
| <urcMode> | integer | 0 | URC presentation mode |
|-----------|---------|---|-----------------------|

Values:

- 0 : disables the presentation of the temperature monitoring URC.
- 1 : enables the presentation of the temperature monitoring URC, whenever the module internal temperature reaches either operating or extreme levels.

| | | | |
|-----------------------|---------|---|---|
| <action> | integer | 0 | sum of integers, each representing the action to be done whenever the module internal temperature reaches either operating or extreme levels. |
|-----------------------|---------|---|---|

Values:

- 0 : no action
- 1 : (01) activating of thermal mitigation according to thermal configuration file, see #TEMPCFG command
- 2 : (10) output pin <GPIO> is tied HIGH when operating temperature bounds are reached; when the temperature is back to normal the output pin <GPIO> is tied LOW. If this <action> is required, it is mandatory to set the <GPIO> parameter too
- 3 : (11) this value contains <action=1> and <action=2>, i.e. activate thermal mitigation and a GPIO indication. If this <action> is required, it is mandatory to set the <GPIO> parameter too.
- 4 : same as 2
- 5÷7 : same as 3

| | | | |
|-------------------------|---------|---|-------------------------------------|
| <hystTime> | integer | - | dummy parameter in the range 0..255 |
|-------------------------|---------|---|-------------------------------------|

| | | | |
|---------------------|---------|---|--|
| <GPIO> | integer | - | GPIO number. Valid range is any GPIO pin as described in #GPIO |
|---------------------|---------|---|--|

command. This parameter is needed and required only if **<action>** 2 or 3 is enabled.
To have hardware information about GPIO refer to document [1].

Unsolicited fields:

| Name | Type | Description |
|----------------------|---------|---|
| <level> | integer | threshold level Values: -2 : extreme low zone, see #TEMPCFG command -1 : operate low zone, see #TEMPCFG command 0 : operate normal zone, see #TEMPCFG command 1 : operate up zone, see #TEMPCFG command 2 : extreme up zone, see #TEMPCFG command |
| <value> | integer | current temperature expressed in Celsius degrees. |

- i** #TEMPCFG command sets the thresholds levels. See there, also the description of the thermal mitigation configuration and its mechanism.
- i** Last **<action>** and **<GPIO>** settings are saved in the file system.

AT#TEMPMON?

Read command reports the current parameter settings for the command in the format:

#TEMPMON: <urcMode>,<action>[,<hystTime> [,<GPIO>]]

AT#TEMPMON=?

Test command reports the supported range of values for parameters <mod>, <urcMode>, <action>, <hystTime>, and <GPIO>.

3.10.14. AT#TESTMODE - Test Mode Configuration

Set module in Test Mode for configuring and testing the POWER level (not signaling mode).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#TESTMODE=<cmd>

The Test Mode is entered using the following commands according to the network technology:

AT#TESTMODE="TM" followed by **AT#TESTMODE="INIT2G"** for 2G networks

AT#TESTMODE="TM" followed by **AT#TESTMODE="INIT4G"** for 4G networks

Only after this set, **AT#TESTMODE** can be used with the other allowed commands. To exit from Test Mode and go back to Operative Mode, enter the command **AT#TESTMODE="OM"**.

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-------|--------|-----|---|
| <cmd> | string | N/A | identifies one of the commands listed in the Values: section. The command is a quoted string. |
|-------|--------|-----|---|

PL4G and **PL2G** commands must be followed by the value of the <pwr> power transmission in tenths of dBm:

AT#TESTMODE="PL4G -100"

AT#TESTMODE="PL2G 300"

CH4G command must be followed by the <earfcn> channel and <bw> bandwidth:

AT#TESTMODE="CHG4 20000 0"

CH2G command must be followed by the **<ch>** channel and **<band>** band:
AT#TESTMODE="CH2G 100 1"

Values:

| | |
|------------------|--|
| "TM" | : forces the module in Test Mode and reboot module |
| "OM" | : forces the module in Operative Mode and reboot module |
| "INIT4G" | : 4G command: initialize Radio for 4G transmission |
| "CH4G earfcn bw" | : 4G command: set the earfcn UL or DL channel for transmitting and receiving and set the bandwidth |
| "PL4G pwr" | : 4G command: change the transmission power. Range is: -400 ÷ 200 in tenths of dBm |
| "TX4G" | : 4G command: starts the non-stop module transmission |
| "RL4G" | : 4G command: reads Rx power level. The value read is in tenths of dBm |
| "DEINIT4G" | : 4G command: de-initialize Radio for 4G transmission and reboot module |
| "INIT2G" | : 2G command: initialize Radio for 2G transmission |
| "CH2G ch band" | : 2G command: set the channel and band |
| "PL2G pwr" | : 2G command: change the transmission power. Range is: -400 ÷ 330 in tenths of dBm |

| | |
|------------|--|
| "TX2G" | : 2G command: starts the non-stop module transmission |
| "RL2G" | : 2G command: reads Rx power level. The value read is in tenths of dBm |
| "DEINIT2G" | : 2G command: de-initialize Radio for 2G operations and reboot module |
| "ESC" | : stop the transmission. This command is valid for both 4G and 2G technologies |
| "TMGNSS" | : Start GNSS testmode |
| "WBIQGNSS" | : Perform WBIQ GNSS test |
| "OMGNSS" | : Exit from GNSS testmode |

Additional info:

| <earfcn> UL | Band |
|-----------------|------|
| 18000 - 18599 | 1 |
| 18600 - 19199 | 2 |
| 19200 - 19949 | 3 |
| 19950 - 20399 | 4 |
| 20400 - 20649 | 5 |
| 21450 - 21799 | 8 |
| 23010 - 23179 | 12 |
| 23180 - 23279 | 13 |
| 23280 - 23379 | 14 |
| 23850 - 23999 | 18 |
| 24000 - 24149 | 19 |
| 24150 - 24449 | 20 |
| 26040 - 26689 | 25 |
| 26690 - 27039 | 26 |
| 27040 - 27209 | 27 |
| 27210 - 27659 | 28 |
| 131972 - 132671 | 66 |
| 133122 - 133471 | 71 |

| | |
|-----------------|----|
| 134002 - 134181 | 85 |
|-----------------|----|

| <earfcn> DL | Band |
|---------------|------|
| 0 - 599 | 1 |
| 600 - 1199 | 2 |
| 1200 - 1949 | 3 |
| 1950 - 2399 | 4 |
| 2400 - 2649 | 5 |
| 3450 - 3799 | 8 |
| 5010 - 5179 | 12 |
| 5180 - 5279 | 13 |
| 5280 - 5379 | 14 |
| 5850 - 5999 | 18 |
| 6000 - 6149 | 19 |
| 6150 - 6449 | 20 |
| 8040 - 8689 | 25 |
| 8690 - 9039 | 26 |
| 9040 - 9209 | 27 |
| 9210 - 9659 | 28 |
| 66436 - 67335 | 66 |
| 68586 - 68935 | 71 |
| 70366 - 70545 | 85 |

| <bw> | Band (MHz) |
|------|------------|
| 0 | 1.4 |
| 1 | 3 |
| 2 | 5 |

| <band> | Band | Channels |
|--------|-----------|-----------------|
| 0 | GSM-850 | 128-251 |
| 1 | E-GSM-900 | 0-124, 955-1023 |
| 2 | DCS-1800 | 512-885 |
| 3 | PCS-1900 | 512-810 |

-  Bands support varies depending on the product
-  2G support varies depending on the product
-  It is not possible to read RX power level during an ongoing TX operation. If a read power level command is issued, transmission is stopped.
-  For RL4G power level test, use a CW (continuous wave) signal with a frequency offset equal to the 40% of the selected bandwidth.
e.g.
Band 1 - BW=1.4MHz - ARFCN 400 (downlink) - 2150.000MHz
CW signal must be set to 2150.560MHz

LTE signal can be also used.

e.g.

Settings: Band 1, BW=1.4MHz, ARFCN 400 (downlink)
corresponding to 2150.000MHz

LTE signal must be set to 2150.000MHz and BW must be set to 1.4MHz

-  The RL4G power level readout is valid in the -90dBm to -30dBm range
-  The tolerance of the power value set with PL4G or read with RL4G is +/-2dB
-  It is recommended to save **CFUN=1** in NVM, before issuing **#TESTMODE**

AT#TESTMODE?

Read command reports the currently selected **<command>** in the format:

#TESTMODE: <testModeStatus>

Additional info:

▶▶ Parameter meaning:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|------------------|---------|---|--------|
| <testModeStatus> | integer | 0 | status |
|------------------|---------|---|--------|

Values:

0 : module is in Operative Mode

1 : module is in Test Mode

AT#TESTMODE=?

Test command returns the **OK** result code

Set Test Mode

```
AT#TESTMODE="TM"
```

OK

Reboot

Initialize Test Mode for 4G operations

```
AT#TESTMODE="INIT4G"
```

OK

set B2 with 1.4 MHz bandwidth, download

```
AT#TESTMODE="CH4G 900 0"
```

OK

read power level

```
AT#TESTMODE="RL4G"
```

```
#TESTMODE: -711
```

OK

set B4 with 1.4 MHz bandwidth, upload

```
AT#TESTMODE="CH4G 20000 0"
```

OK

start transmission

```
AT#TESTMODE="TX4G"
```

OK

stop transmission

```
AT#TESTMODE="ESC"
```

OK

exit from Test Mode

```
AT#TESTMODE="OM"
```

OK

Reboot

3.11. Power Down

3.11.1. AT#REBOOT - Module Reboot

Immediate module reboot.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#REBOOT

Execution command reboots immediately the unit.

It can be used to reboot the system after a remote update of the script in order to have the new one running.

-  If **#REBOOT** follows an AT command that stores some parameters in NVM, it is recommended to insert a delay of at least 5 seconds before to issue **#REBOOT**, to permit the complete NVM storing.
-  **#REBOOT** is an obsolete AT command; please refer to **#ENHRST** to perform a module reboot.

AT#REBOOT=?

Test command returns **OK** result code.

- Reboot the module
AT#REBOOT
OK
(the module reboots)

3.11.2. AT#ENHRST - Periodic Reset

Enable or Disable the one shot or periodic unit reset

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ENHRST=<mode>,<delay>

Set commands enables/disables the unit reset after the specified <delay> in minutes

Parameters:

| Name | Type | Default | Description |
|---------|---------|---|--|
| <mode> | integer | 0 | Enable\Disable mode |
| Values: | | | |
| 0 | : | disables the unit reset | |
| 1 | : | enables the unit reset only one time (one shot reset) | |
| 2 | : | enables periodically unit reset | |
| <delay> | integer | - | time interval in minutes after that the unit reboots |

-  The settings are saved automatically in NVM only if old or new <mode> value is 2, i.e. unit set in periodic reset mode. Therefore, any change from 0 to 1 or conversely is not stored in NVM.
-  The command **AT#ENHRST=1,0** causes the immediate module reboot. If it follows an AT command that stores some parameters in NVM, it is strongly recommended to insert a delay of at least 5 sec before issuing it, to permit the complete NVM storing process.

**AT#ENHRST?**

Read command reports the current parameter settings in the following format:

#ENHRST: <mode>[,<delay>,<remainingTime>]

Additional info:

- ▶▶ Read command parameter for **<mode>** =1 or 2.

| Name | Type | Default | Description |
|-----------------|---------|---------|---|
| <remainingTime> | integer | - | time in minutes remaining before next reset |

**AT#ENHRST=?**

Test command reports supported range of values for parameters **<mode>** and **<delay>**.

Example of **#ENHRST** usage and expected unit behavior.

- **AT#ENHRST=1,60**
...
Module reboots after 60 minutes
- **AT#ENHRST=1,0**
Module reboots immediately
- **AT#ENHRST=2,40**
...
Module reboots after 40 minutes, and after every following power on, it will continue to reboot always after 40 minutes.

3.11.3. AT#SHDN - Software Shutdown

This command turns the module OFF.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SHDN

Execution command causes device to detach from the network and shut down. Before definitive shut down an **OK** response is returned.

When issuing the command any previous activity terminated and the device will not respond to any further command.

To turn it on again hardware pin ON/OFF must be tied low.

The maximum time to shut down the device, completely is 25 seconds.

AT#SHDN=?

Test command returns **OK** result code.

3.11.4. AT#SYSHALT - System Turn-Off

The execution command sets the module in SYSHALT state. To power down the module, the serial port (ASC0) must have the control signals CTS, DTR, DCD and RING low.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SYSHALT?

Read command returns the current stored parameters in the following format:

SYSHALT: <GPIORestore>,<DTRWakeUpEn>,<RebootEn>

Additional info:

- ▶▶ Here are the parameters meanings.

| Name | Type | Default | Description |
|---------------|---------|---------|--|
| <GPIORestore> | integer | 0 | select the GPIOs and serial ports pins setting |

Values:

0 : GPIOs and serial ports pins are left unchanged

1 : GPIO and serial pins are set in input with pull down

| | | | |
|---------------|---------|---|-------------------------|
| <DTRWakeUpEn> | integer | 0 | select the DTR behavior |
|---------------|---------|---|-------------------------|

Values:

- 0 : DTR has no effect on module turned OFF by #SYSHALT
- 1 : DTR transition from low to high turns on again the module turned off by #SYSHALT command

| | | | |
|-------------------------|---------|---|-------------------------------------|
| <RebootEn> | integer | 1 | select how the module exits SYSHALT |
|-------------------------|---------|---|-------------------------------------|

Values:

- 0 : module exits from SYSHALT and stays in detached mode like CFUN=4 status. To restore normal behavior, the user shall set CFUN=1
 - 1 : module exits from SYSHALT performing a total reboot
-

 The parameters are not settable.

AT#SYSHALT=?

Test command returns the supported range of parameters values in the format:

SYSHALT: (0-1),(0-1),(0-1)

3.11.5. AT#FASTSHDN - Fast Shutdown Configuration

This command can be used as a set command to configure a GPIO pin performing a fast shutdown when on it is forced a High to Low level transition. Or can be used as an execute command to force immediately a fast shutdown.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#FASTSHDN[=<enable>[,<GPIO>]]

Parameters:

| Name | Type | Default | Description |
|--------------|---------|---------|---|
| <enable> | integer | 0 | enable/disable the fast shutdown execution via a GPIO pin. |
| Values: | | | |
| 0 : disabled | | | |
| 1 : enabled | | | |
| <GPIO> | integer | - | selects the GPIO to execute the fast shutdown. When the selected <GPIO> pin goes from High to Low level and the <enable> is set to 1, the module execute immediately the fast shutdown. |

Additional info:

- ▶▶ The execution command **#FASTSHDN**<CR><LF> forces the module to execute immediately the fast shutdown.

-  The GPIO pin selected by the **#FASTSHDN** command must be used for this purpose only. If you need to use the selected GPIO pin for different activities, it must be free with the following command:

```
#FASTSHDN=0,<GPIO>
```

AT#FASTSHDN?

Read command reports the currently selected configuration in the format:

```
AT#FASTSHDN: <enable>,<GPIO>
```

AT#FASTSHDN=?

Test command returns the supported range of values for all the parameters.

Enable fast shutdown on GPIO_05

```
AT#FASTSHDN=1,5
```

```
OK
```

```
AT#FASTSHDN?
```

```
#FASTSHDN: 1,5
```

```
OK
```

Force immediate fast shutdown

```
AT#FASTSHDN
```

```
OK
```

3.11.6. AT#DGEN - Dying GASP Configuration

This command enables/disables the Dying GASP configuration, configures a GPIO pin to perform a specific behavior at dying gasp of module, can also be used to read the last dying event.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#DGEN=<mode>[,<GPIO>,<Trigger>,<Action>,<URC>[,<text>,<text_format>[,<SMS_Num>] [,<cid>,<IPProtocol>[,<IPAddr:Port>]]]]**

Parameters:

| Name | Type | Default | Description |
|--------------------------------|---------|---------|--|
| <mode> | integer | 0 | enable/disable dying GASP behavior or read report |
| Values: | | | |
| 0 : disable dying GASP | | | |
| 1 : set the command parameters | | | |
| 2 : read dying GASP statistics | | | |
| <GPIO> | integer | N/A | GPIO pin number. Max is the number of GPIO pins provided by the module. For information on the available GPIO pins use the test command. |
| Value: | | | |
| 1÷Max : GPIO pin identifier | | | |
| <Trigger> | integer | 0 | GPIO Trigger used for event |

Values:

- 0 : activate dying gasp when GPIO translates from high to low
- 1 : activate dying gasp when GPIO translates from low to high

| | | | |
|-----------------------|--------|---|-------------------|
| <Action> | string | 0 | Dying GASP Action |
|-----------------------|--------|---|-------------------|

Values:

- 0 : disable both SMS and IP (TCP or UDP) connection
- 1 : send SMS
- 2 : use IP (TCP or UDP) connection
- 3 : send SMS and use IP (TCP or UDP) connection

| | | | |
|--------------------|---------|---|-----------------------|
| <URC> | integer | 0 | URC presentation mode |
|--------------------|---------|---|-----------------------|

Values:

- 0 : disables the presentation of the notification URC
- 1 : enables the presentation of the notification URC when GPIO interrupt is triggered

| | | | |
|---------------------|--------|---|---|
| <text> | string | - | <p>the format of text is determined by <text_format>.</p> <p>When <text_format> = 0 (text), content of <text> is a string of 8-bit ASCII text character. Max 160 chars.</p> <p>When <text_format> = 1 (binary), every 8-bit octet of the message must be written as two IRA character long hexadecimal numbers, e.g. an octet with integer value 30 (i.e. 0x1E) must be written as a string of two characters "1E" (IRA 49 and 69) it must be enter in uppercase.</p> |
|---------------------|--------|---|---|

| | | | |
|--|---------|---|--|
| <text_format> | integer | 0 | format of the <text> parameter |
| Values: | | | |
| 0 : text | | | |
| 1 : binary | | | |
| <SMS_Num> | string | - | SMS Destination Number as string of 8-bit ASCII Characters. Max 20 chars. International format is requested (without '+'). This value is not mandatory if Action = 2 |
| <cid> | string | - | specifies a PDP context definition. To know the range, see +CGDCONT command |
| <IPProtocol> | integer | 0 | IP protocol used for socket connection. |
| Values: | | | |
| 0 : disable IP (both TCP and UDP) connection | | | |
| 1 : TCP protocol | | | |
| 2 : UDP protocol | | | |
| <IPAddr:Port> | string | - | IPv4 server address with the socket port. Number as string of 8bit ASCII Characters. Max 20 chars. If IPProtocol = 2 (UDP) local socket port will be the same of server socket port. |

Additional info:

- ▶▶ 37. If **<Action>=1** parameters **<cid>**, **<IPProtocol>**, and **<IPAddr:Port>** are not mandatory
- 38. If **<Action>=2** parameter **<SMS_Num>** is not mandatory
- 39. If **<Action>=3**, SMS has always more priority than IP connection
- 40. If **<IPProtocol>=0** parameter **<IPAddr:Port>** is not mandatory

- If `<mode>=2` the command returns the following report:
#DGSTAT: <TimeStamp>, <SMSAttemptedFlag>

If no report is present the result is:

#DGSTAT: 0,0

Any additional parameter will report an error.

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|--|
| <code><TimeStamp></code> | string | - | timestamp of the last time power loss was detected and Dying Gasp feature was triggered. |
| <code><SMSAttemptedFlag></code> | integer | N/A | indicates whether device attempted to send message (by SMS, IP or both) in the last power loss event, does not guarantee network delivery. |

Values:

0 : message not attempted

1 : message attempted

- If `<URC>=1` the module returns the following unsolicited message in the format:
#DGEN: <GPIO>, <text>

If parameter `<Action>=0`, not activated:

#DGEN: <GPIO>

- i** Full configuration is stored in NVM.

 **AT#DGEN?**

Read command reports the current settings of parameters, in the format:

#DGEN: <mode>,<GPIO>, <Trigger>, <Action>, <URC>, <text> , <text_format>,
<SMS_Num>,<cid>,<IPProtocol>,<IPAddr:Port>

At the very first boot no settings are present so read command will report a default message:

#DGEN: 0

 **AT#DGEN=?**

Test command reports the supported range of the parameters values.

Set command (SMS only)
AT#DGEN=1,2,0,1,1,"shutdown",0,"01012345678"
OK

Set command (IP-TCP only)
AT#DGEN=1,2,0,2,1,"shutdown",0,,1,1,"192.168.0.10:8080"
OK

Set command (SMS and IP-UDP)
AT#DGEN=1,2,0,3,1,"shutdown",0,"01012345678",1,2,"192.168.0.10:8080"
OK

Read command
AT#DGEN?AT#DGEN=1,2,0,3,1,"shutdown",0,"01012345678",1,2,"192.168.0.10:8080"
OK

Set command (active on PGIO=3 without sending messages)
AT#DGEN=1,3,0,0,1
OK

Set command (disable feature)
AT#DGEN=0
OK

Set command (activate with last valid configuration)
AT#DGEN=1
OK

3.12. Easy Scan

3.12.1. AT#CSURV - Network Survey

The command performs a survey on the selected band channels.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#CSURV=[<s>,<e>]

Execution command performs a quick survey on channels belonging to the band selected by last **#BND** command issue, starting from channel **<s>** to channel **<e>**.

Network registration is required.

Issuing **AT#CSURV<CR>**, a full band scan is performed. The command responds with the following string:

Network survey started...

After a while, a list of network survey information text lines, one for each received carrier, is reported. The format of network survey information text lines depends on technology (2G or 4G) and BCCH (BCCH-Carrier or non BCCH-Carrier).

The **#CSURV** output ends in two ways, depending on the last **#CSURVF** setting.

If **AT#CSURVF=0** or **AT#CSURVF=1** the output will end with the string:

41. **Network survey ended**

If **AT#CSURVF=2** the output will end with the string:

42. **Network survey ended (Carrier: <NoARFCN> BCCh: <NoBCCh>)**

The network survey information text lines are described in the Additional info sections.

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-----|---------|---|-------------------------------------|
| <s> | integer | - | starting channel, see note section. |
| <e> | integer | - | ending channel, see note section. |

Additional info:

▶▶ 2G Networks, for BCCH-Carrier

Network survey information text lines:

```
arfcn: <arfcn> bsic: <bsic> rxLev: <rxLev> ber: <ber> mcc: <mcc>
mnc: <mnc>
lac: <lac> cellId: <cellId> cellStatus: <cellStat> numArfcn:
<numArfcn> arfcn:
<CR><LF><CR><LF><CR><LF>
```

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <arfcn> | integer | - | C0 carrier assigned radio channel (BCCH - Broadcast Control Channel) |
| <bsic> | integer | - | base station identification code; if #CSURVF last setting is 0, <bsic> is a decimal number, else it is at the most a 2-digits octal number |
| <rxLev> | integer | - | decimal number; it is the reception level (in dBm) |
| <ber> | integer | - | always 0, dummy parameter |
| <mcc> | hex | - | hexadecimal 3-digits number; it is the mobile country code |
| <mnc> | hex | - | hexadecimal 2-digits number; it is the mobile network code |
| <lac> | integer | - | location area code; if #CSURVF last setting is 0, <lac> is a decimal number, else it is a 4-digits hexadecimal number |

| | | | |
|-------------------------|---------|-----|---|
| <cellId> | integer | - | cell identifier; if #CSURVF last setting is 0, <cellId> is a decimal number, else it is a 4-digits hexadecimal number |
| <cellStat> | string | N/A | cell status |
| Values: | | | |
| CELL_SUITABLE | : | | C0 is a suitable cell |
| CELL_LOW_PRIORITY | : | | the cell is low priority based on the received system information |
| CELL_FORBIDDEN | : | | the cell is forbidden |
| CELL_BARRED | : | | the cell is barred based on the received system information |
| CELL_LOW_LEVEL | : | | the cell <rxLev> is low |
| CELL_OTHER | : | | none of the above (e.g. exclusion timer running, no BCCH available, etc.) |
| <numArfcn> | integer | - | always 0, dummy parameter |

►► 2G Networks, for non BCCH-Carrier

Network survey information text lines:

arfcn: **<arfcn>** rxLev: **<rxLev>**
<CR><LF><CR><LF><CR><LF>

| Name | Type | Default | Description |
|----------------------|---------|---------|--------------------------------------|
| <arfcn> | integer | - | decimal number; it is the RF channel |

<rxLev> integer - decimal number; it is the reception level (in dBm)

►► 4G Networks

Network survey information text lines for CATM:

earfcn: <earfcn> rxLev: <rxLev> mcc: <mcc> mnc: <mnc> cellld: <cellld> tac: <tac> cellldentity: <cellldentity>

or for NBloT

earfcn: <earfcn> rxLev: <rxLev> mcc: <mcc> mnc: <mnc>

NBloTcellld: <cellld> tac: <tac> cellldentity: <cellldentity>

earfcn: <earfcn> rxLev: <rxLev> cellld: <cellld>

| Name | Type | Default | Description |
|----------------|---------|---------|---|
| <earfcn> | integer | - | E-UTRA Assigned Radio Channel |
| <tac> | string | - | Tracking Area Code. If #CSURVF last setting is 0, <cellld> is a decimal number, else it is a 4-digits hexadecimal number |
| <cellld> | integer | - | Physical cell identifier, if #CSURVF last setting is 0, <cellld> is a decimal number, else it is a hexadecimal number |
| <cellldentity> | integer | - | Cell identifier, if #CSURVF last setting is 0, <cellldentity> is a decimal number, else it is a hexadecimal number |

►► **#CSURV** end output parameters if **AT#CSURVF=2**:

Network survey ended (Carrier: <NoARFCN> BCCh: <NoBCCh>)

| Name | Type | Default | Description |
|-----------|---------|---------|-------------------------------|
| <NoARCFN> | integer | - | number of scanned frequencies |
| <NoBCCH> | integer | - | number of found BCCH |

2G Network

<s> and <e> parameters can assume the values shown in the Channels Ranges column, according to the module in use.

| Channels Ranges | GSM Bands |
|-----------------|-----------|
| 0,124 | GSM900 |
| 975,1023 | GSM900 |
| 512,885 | DCS1800 |
| 128,251 | GSM850 |
| 512,810 | PCS1900 |

4G Network

<s> and <e> parameters can assume the values shown in the Channels Ranges column, according to the module in use.

| Channels Ranges | LTE Bands |
|-----------------|-----------|
| 0,599 | 1 |
| 600,1199 | 2 |
| 1200,1949 | 3 |
| 1950,2399 | 4 |
| 2400,2649 | 5 |
| 3450,3799 | 8 |
| 5010,5179 | 12 |
| 5180,5279 | 13 |
| 5850,5999 | 18 |
| 6000,6149 | 19 |
| 6150,6449 | 20 |
| 8690,9039 | 26 |
| 9210,9659 | 28 |

3.12.2. AT#CSURVC - Network Survey (Numeric Format)

This command performs a survey on the selected band channels. The return message uses only the numeric format.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CSURVC=[<s>,<e>]]

Execution command performs a quick survey on channels belonging to the band selected by last **#BND** command issue, starting from channel **<s>** to channel **<e>**. The information provided by this command is the same as that provided by **#CSURV** command. The difference is that the output of **#CSURV** is in numeric format only, the parameters names are not reported

Issuing **AT#CSURC<CR>**, a full band scan is performed. The command responds with the following string:

Network survey started...

After a while, a list of network survey information text lines in numeric format, one for each received carrier, is reported. The format of network survey information text lines depends on technology (2G or 4G) and BCCH (BCCH-Carrier or non BCCH-Carrier).

The **#CSURVC** output ends in two ways, depending on the last **#CSURVF** setting. If **AT#CSURVF=0** or **AT#CSURVF=1** the output will end with the string:

43. **Network survey ended**

If **AT#CSURVF=2** the output will end with the string:

44. **Network survey ended (Carrier: <NoARFCN> BCCh: <NoBCCh>)**

The network survey information text lines are described in the Additional info sections.

Parameters:

| Name | Type | Default | Description |
|------|---------|---------|--|
| <s> | integer | - | starting channel, see #CSURV command. |

<e> integer - ending channel, see **#CSURV** command.

Additional info:

► 2G Networks, for BCCH-Carrier

Network survey information text lines:

```
<arfcn>,<bsic>,<rxLev>,<ber>,<mcc>,<mnc>,<lac>,<cellId>,<cellStat>,<numArfcn>
<CR><LF><CR><LF><CR><LF>
```

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <arfcn> | integer | - | C0 carrier assigned radio channel (BCCH - Broadcast Control Channel) |
| <bsic> | integer | - | base station identification code; if #CSURVF last setting is 0, <bsic> is a decimal number, else it is at the most a 2-digits octal number |
| <rxLev> | integer | - | decimal number; it is the reception level (in dBm) |
| <ber> | integer | - | always 0, dummy parameter |
| <mcc> | hex | - | hexadecimal 3-digits number; it is the mobile country code |
| <mnc> | hex | - | hexadecimal 2-digits number; it is the mobile network code |
| <lac> | integer | - | location area code; if #CSURVF last setting is 0, <lac> is a decimal number, else it is a 4-digits hexadecimal number |
| <cellId> | integer | - | cell identifier; if #CSURVF last setting is 0, <cellId> is a decimal number, else it is a 4-digits hexadecimal number |
| <cellStat> | string | N/A | cell status |

Values:

CELL_SUITABLE : C0 is a suitable cell

| | | |
|-------------------|---|---|
| CELL_LOW_PRIORITY | : | the cell is low priority based on the received system information |
| CELL_FORBIDDEN | : | the cell is forbidden |
| CELL_BARRED | : | the cell is barred based on the received system information |
| CELL_LOW_LEVEL | : | the cell <rxLev> is low |
| CELL_OTHER | : | none of the above (e.g. exclusion timer running, no BCCH available, etc.) |

<numArfcn> integer - always 0, dummy parameter

► 2G Networks, for non BCCH-Carrier

Network survey information text lines:

<arfcn>,<rxLev>
<CR><LF><CR><LF><CR><LF>

| Name | Type | Default | Description |
|---------|---------|---------|--|
| <arfcn> | integer | - | decimal number; it is the RF channel |
| <rxLev> | integer | - | decimal number; it is the reception level (in dBm) |

► 4G Networks

Network survey information text lines:

<earfcn>,<rxLev>,<mcc>,<mnc>,<cellld>,<tac>,<cellIdentity>

| Name | Type | Default | Description |
|----------|---------|---------|--------------------------------|
| <earfcn> | integer | - | E-UTRA Assigned Radio Channel. |

| | | | |
|----------------|---------|---|--|
| <tac> | integer | - | Tracking Area Code. If #CSURVF last setting is 0, <cellid> is a decimal number, else it is a 4-digits hexadecimal number. |
| <cellid> | integer | - | Physical cell identifier, if #CSURVF last setting is 0, <cellid> is a decimal number, else it is a hexadecimal number |
| <cellIdentity> | integer | - | Cell identifier, if #CSURVF last setting is 0, <cellIdentity> is a decimal number, else it is a hexadecimal number |

► **#CSURVC** end output parameters if **AT#CSURVF=2**:

Network survey ended (Carrier: <NoARFCN> BCCh: <NoBCCh>)

| Name | Type | Default | Description |
|-----------|---------|---------|-------------------------------|
| <NoARFCN> | integer | - | number of scanned frequencies |
| <NoBCCH> | integer | - | number of found BCCH |

</> 2G Network, for BCCH-Carrier

...

Network survey ended

OK

3.12.3. AT#CSURVF - Network Survey Format

The command configures the numbers format used in the messages related to the surveying of the network bands channels.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CSURVF=[<format>]

Set command configures the numbers format in each information text line of the network survey message (Easy Scan (R)).

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <format> | integer | 0 | format of some numbers (see #CSURV and #CSURVC) in each network survey information text line |

Values:

0 : Decimal

1 : Hexadecimal

2 : Hexadecimal and extended network survey end message format

AT#CSURVF?

Read command reports the current format of the numbers in each network survey information text line, as follows:

#CSURVF: <format>

AT#CSURVF=?

Test command reports the supported range of values for the parameter **<format>**.

3.12.4. AT#CSURVNLF - Network Survey CR LF Removing

This command enables/disables the automatic <CR><LF> removing from each network survey information text line.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CSURVNLF=[<value>]

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <value> | integer | 0 | enables/disables the automatic <CR><LF> removing from each network survey information text line |

Values:

- 0 : disables <CR><LF> removing; they will be present in the information text line
- 1 : enables <CR><LF> removing from information text line

AT#CSURVNLF?

Read command reports whether the automatic <CR><LF> removing from each network survey information text line is currently enabled or not, in the format:

<value>

AT#CSURVNLF=?

Test command reports the range of values for parameter <value>.

3.12.5. AT#CSURVEXT - Extended Network Survey

The command is present only for backward compatibility.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#CSURVEXT=[<value>]

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|-----------------|
| <value> | integer | 0 | dummy parameter |

Values:

0 : dummy value

1 : dummy value

2 : dummy value

AT#CSURVEXT?

Read command reports current dummy value.

#CSURVEXT: <value>

AT#CSURVEXT=?

Test command reports the range of values for dummy parameter <value>.

3.13. Jamming Detection and Report

3.13.1. AT#JDRENH2 - Enhanced Jamming Detection and Report

This command enables/disable jamming detection, and reports the relative result to the user.

[1] Hardware User's Guide of the used module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#JDRENH2=<mode>[,<sat2G>,<unused>,<carrNum2G>,<pRxLevT2G>,<unused>,<unused>,<unused>[,<P_RSSI_T4G>[,<P_RSRQ_T4G>[,<unused>]]]]

The set command performs the following activities:

45. enables/disables the detection of the presence of jamming in the module coverage.
46. selects one of the following two reports mode or both: on dedicated GPIO, by means of the URC, or GPIO + URC.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | enable/disable jamming detection and select reporting mode |

Values:

- 0 : disable jamming detection
- 1 : enable jamming detection, and report its condition on a GPIO pin, see Additional info section

- 2 : enable jamming detection, and report its condition with an URC, see Additional info section
- 3 : enable jamming detection, and report its condition as <mode>=1 and <mode>=2
- 4 : enable jamming detection, and report its condition with an URC every 3 sec, see <mode>=2
- 5 : enable jamming detection, and report its condition as <mode>=1 and <mode>=4
- 6 : not used

| | | | |
|----------------------|---------|----|--|
| <sat2G> | integer | 60 | is the starting absolute threshold of RSSI 2G Network. After a frequency scan in 2G bands, if the measured power of a carrier is greater than <sat2G> threshold, that carrier is counted as possible jammed carrier. |
|----------------------|---------|----|--|

Value:

0÷63 : threshold values

| | | | |
|-----------------------|---------|-----|------------------|
| <unused> | integer | N/A | unused parameter |
|-----------------------|---------|-----|------------------|

Value:

0 : dummy value

| | | | |
|--------------------------|---------|-----|--|
| <carrNum2G> | integer | 100 | is the minimum number of possible jammed carriers to consider that the module is under jamming condition |
|--------------------------|---------|-----|--|

Value:

0÷200 : number of carriers

| | | | |
|---------------------------|---------|-----|--|
| <pRxLevT2G> | integer | 15 | set the threshold of RxLev in 2G Network. The RxLev_Thr threshold is calculated as shown below: $\text{RxLev_Thr} = \text{RxLev_Av} * (1 + \{\text{<pRxLevT2G>/100\})$ where RxLev_Av is the average of the last 10 RxLev measures. Value: 0÷100 : values used to compute RxLev_Thr threshold |
| <unused> | integer | N/A | unused parameter Value: 0 : dummy value |
| <unused> | integer | N/A | unused parameter Value: 0 : dummy value |
| <unused> | integer | N/A | unused parameter Value: 0 : dummy value |
| <P_RSSI_T4G> | integer | 10 | Set the threshold of RSSI. The threshold (T_RSSI_MAX/T_RSSI_MIN) is calculated as: $\text{T_RSSI_MAX} = \text{RSSI_Avg} * (1 + \{\text{<P_RSSI_T4G>/100\})$ $\text{T_RSSI_MIN} = \text{RSSI_Avg} * (1 - \{\text{<P_RSSI_T4G>/100\})$ |

where `RSSI_Avg` is the average of the last 50 RSSI measures.

Value:

0÷100 : RSSI threshold values

| | | | |
|---------------------------------|---------|----|---|
| <code><P_RSRQ_T4G></code> | integer | 20 | Set the threshold of RSRQ. The threshold (<code>RSRQ_Thr</code>) is calculated as $\text{RSRQ_Thr} = \text{RSRQ_Avg} * (1 - (\text{<P_RSRQ_T4G>/100})$ |
|---------------------------------|---------|----|---|

where `RSRQ_Avg` is the average of the last 50 RSRQ measures.

Value:

0÷100 : RSRQ threshold values

| | | | |
|-----------------------------|---------|---|------------------|
| <code><unused></code> | integer | 0 | unused parameter |
|-----------------------------|---------|---|------------------|

Value:

0 : dummy value

Additional info:

▶▶ `<mode>=1`

The jamming condition is reported on pin `GPIO_02 (JDR)`:

- 47. `GPIO_02 (JDR) = Low, Normal Operating Condition`
- 48. `GPIO_02 (JDR) = High, Jammed Condition`

To have information on `GPIO_02` pin, refer to document [1]. `GPIO_02` pin can be used also by other functionality, see **#GPIO** command.

▶▶ `<mode>=2`

the jamming condition is reported with a single URC on serial line, in the format:

#JDR: <status>

Unsolicited field:

| Name | Type | Description |
|----------|---------------|--|
| <status> | string | jamming condition status, <mode>=2 |
| | | Values: |
| | JAMMED RAT | : jamming condition detected, <RAT> is the Radio Access Technology for operates: GSM or LTE. |
| | OPERATIVE RAT | : Normal Operating condition restored. Status shown only after a jamming condition has occurred. |

AT#JDRENH2?

Read command reports the current parameters values, in the format:

```
#JDRENH2:<mode>,<sat2G>,0,<carrNum2G>,<pRxLevT2G>,0,0,0,<P_RSSI_T4G>,<P_RSRQ_T4G>,0
```

AT#JDRENH2=?

Test command reports the supported range of the parameters values.

3.13.2. AT#JDR4GCFG - LTE Jamming Detection Threshold Configuration

The command configures the LTE Jamming Detection thresholds.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

➡ **AT#JDR4GCFG=<P_RSRP_T4G>,<P_RSRQ_T4G>,<Initial_Delay>[,<Sampling_Number>[,<P_RSSI_S4G>[,<UNUSED_4>[,<UNUSED_5>[,<UNUSED_6>[,<UNUSED_7>]]]]]]]**

Set command allows to configure the LTE Jamming Detection thresholds. After configuration, use the **#JDRENH2** command to enable/disable LTE jamming detection and select reporting mode.

Parameters:

| Name | Type | Default | Description |
|--------------|---------|---------|--|
| <P_RSRP_T4G> | integer | 10 | set the threshold of RSRP. The threshold (RSRP_Thr) is calculated as: $\text{RSRP_Thr} = \text{RSRP_Av} * (1 + \{<P_RSRP_T4G> / 100\})$ where RSRP_Av is the average of the last 8 RSRP measures Value: 0÷100 : threshold of RSRP |
| <P_RSRQ_T4G> | integer | 20 | set the threshold of RSRQ. The threshold (RSRQ_Thr) is calculated as: $\text{RSRQ_Thr} = \text{RSRQ_Av} * (1 - \{<P_RSRQ_T4G> / 100\})$ where RSRQ_Av is the average of the last 8 RSRQ measures Value: |

| | | | |
|-------------------|---------|----------|---|
| | | 0÷100 | : threshold of RSRQ |
| <Initial_Delay> | integer | 500 | Sets the delay in tens of ms from power ON, to the beginning of the RSSI samples collection |
| | Value: | | |
| | | 0÷1000 | : Value of Initial Delay |
| <Sampling_Number> | integer | 30 | Number of samples required to validate the Jamming condition. |
| | Value: | | |
| | | 1÷200 | : Number of samples |
| <P_RSSI_S4G> | integer | -50 | RSSI threshold level in dBm, above which the Jamming condition is detected. |
| | Value: | | |
| | | -120÷-20 | : Value of RSSI Threshold |
| <UNUSED_4> | mixed | - | reserved for future use |
| <UNUSED_5> | mixed | - | reserved for future use |
| <UNUSED_6> | mixed | - | reserved for future use |
| <UNUSED_7> | mixed | - | reserved for future use |

AT#JDR4GCFG?

Read command returns the current settings in the format:

#JDR4GCFG:

<P_RSRP_T4G>,<P_RSRQ_T4G>,>,<Initial_Delay>,<Sampling_Number>,<P_RSSI_S4G>,0,0,0,0

Regardless the values used for parameters <UNUSED_4> ... <UNUSED_7>, the read command returns always 0.

?  **AT#JDR4GCFG=?**

Test command returns the range of supported values for all the parameters.

3.14. Packet Domain

3.14.1. AT+CGDCONT - Define PDP Context

Define PDP Context.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

➔ **AT+CGDCONT=[<cid>[,<PDP_type>[,<APN>[,<PDP_addr>[,<d_comp>[,<h_comp>[,<IPv4AddrAlloc>[,<emergencyIndication>]]]]]]]]]**

Set command specifies PDP context parameter values for a PDP context identified by the (local) context identification parameter, <cid>.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <cid> | integer | - | (PDP Context Identifier) numeric parameter which specifies a particular PDP context definition. 1..max - where the value of max is returned by the Test command. |
| <PDP_type> | string | N/A | (Packet Data Protocol type) a string parameter which specifies the type of packet data protocol. |

Values:

"IP" : Internet Protocol

"IPv6" : Internet Protocol version 6

"IPV4V6" : Virtual introduced to handle dual IP stack UE capability.

Non-IP : Transfer of Non-IP data to external packet data network

| | | | |
|------------|---------|---|---|
| <APN> | string | - | (Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network. If the value is empty ("") or omitted, then the subscription value will be requested. |
| <PDP_addr> | string | - | A string parameter that identifies the terminal in the address space applicable to the PDP. The allocated address may be read using the +CGPADDR command. |
| <d_comp> | integer | 0 | Numeric parameter that controls PDP data compression. |

Values:

0 : PDP data compression off (default if value is omitted)

1 : PDP data compression on

2 : V.42bis (applicable only for products supporting GSM)

| | | | |
|----------|---------|---|---|
| <h_comp> | integer | 0 | Numeric parameter that controls PDP header compression. |
|----------|---------|---|---|

Values:

0 : PDP header compression off (default if value is omitted)

- 1 : PDP header compression on
- 2 : RFC1144 (applicable only for products supporting GSM; applicable for SNDCP only)
- 3 : RFC2507 (applicable only for products supporting GSM)
- 4 : RFC3095 (applicable only for products supporting GSM; applicable for PDCP only)

| | | | |
|------------------------------|---------|---|---|
| <IPv4AddrAlloc> | integer | 0 | a numeric parameter that controls how the MT/TA requests to get the IPv4 address information. |
|------------------------------|---------|---|---|

Value:

- 0 : IPv4 Address Allocation through NAS Signaling (default)

| | | | |
|------------------------------------|---------|---|---|
| <emergencyIndication> | integer | 0 | a numeric parameter used to indicate whether the PDP context is for emergency bearer services or not. |
|------------------------------------|---------|---|---|

Value:

- 0 : PDP context is not for emergency bearer services (default)
-

- i** To erase all params for a <cid> give as follows:
AT+CGDCONT=<cid>,<pdp_type>,""

AT+CGDCONT?

Read command returns the current settings for each defined context in the format:

```
+CGDCONT: <cid>,<PDP_type>,<APN>,<PDP_addr>,<d_comp>,<h_comp>,0,0<CR><
LF>
```

```
+CGDCONT: <cid>,<PDP_type>,<APN>,<PDP_addr>,<d_comp>,<h_comp>,0,0[...]
```

AT+CGDCONT=?

Test command returns values supported as a compound value.

```
</> AT+CGDCONT=1,"IP","APN","10.10.10.10",0,0
OK
AT+CGDCONT?
+CGDCONT: 1,"IP","APN","10.10.10.10",0,0,0,0
OK
AT+CGDCONT=?
+CGDCONT: (1-6),"IP" ,,,(0-2),(0-4),0,0
+CGDCONT: (1-6),"IPV6" ,,,(0-2),(0-4),0,0
+CGDCONT: (1-6),"IPV4V6" ,,,(0-2),(0-4),0,0
OK
```

3.14.2. AT+CGPADDR - Show PDP Address

This command returns a list of PDP addresses for the specified context identifiers.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CGPADDR=[<cid>[,...]]

Execution command returns a list of PDP addresses for the specified context identifiers.

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|--|
| <cid> | integer | - | specifies a PDP context definition, see +CGDCONT command. If no <cid> specified, the addresses for all defined contexts are returned. |

Additional info:

- ▶▶ The command returns a row of information for every <cid> whose context has been defined. No row is returned for a <cid> whose context has not been defined. Here is the response format:

```
+CGPADDR: <cid>,<PDP_addr><CR><LF>
```

```
+CGPADDR: <cid>,<PDP_addr><CR><LF>
```

```
...
```

| Name | Type | Default | Description |
|------------|--------|---------|---|
| <PDP_addr> | string | - | identifies the terminal in an address space applicable to the |

PDP. The address may be static or dynamic:

49. for a static address, it will be the one set by the **+CGDCONT** command when the context was defined
50. for a dynamic address it will be the one assigned during the last PDP context activation that used the context definition referred to by **<cid>**; **<PDP_addr>** is omitted if none is available

AT+CGPADDR=?

Test command returns a list of defined **<cid>**.

```
AT#SGACT=3,1
#SGACT: xxx.yyy.zzz.www
OK
```

```
AT+CGPADDR=3
+CGPADDR: 3,"xxx.yyy.zzz.www"
OK
```

```
AT+CGPADDR=?
+CGPADDR: {3}
OK
```

3.14.3. AT#AUTOATT - Auto-Attach Property

Execution command has no effect and is included only for backward compatibility.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#AUTOATT=[<auto>]

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|-----------------|
| <auto> | integer | 0 | dummy parameter |

Values:

0 : dummy parameter

1 : dummy parameter

 Entering **AT#AUTOATT=** returns **OK** but has no effect.

AT#AUTOATT?

Read command reports <auto> value, in the format:

#AUTOATT: <auto>

AT#AUTOATT=?

Test command reports available values for parameter <auto>.

3.14.4. AT#BSRCFG - Buffer Status Reporting (BSR) Configuration

This command configures the Buffer Status reporting timers.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT#BSRCFG=<idleTo>

Execution command sets the idle timeout value of Buffer Status Reporting.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|------------------------|
| <idleTo> | integer | N/A | Timer value in seconds |

Value:

1÷1800 : Timer value in seconds

-  The BSR setting has only effect on LTE Cat.M and NB-IoT (User Plane) technologies.

AT#BSRCFG?

Read command returns the current <idleTo> time in the format:

#BSRCFG: <idleTo>

AT#BSRCFG=?

Test command reports the supported range of values of <idleTo> in seconds.

3.14.5. AT#MSCLASS - Multislot Class Control

Set command sets the GPRS multislot class.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#MSCLASS=[<class>[,<autoattach>]]

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|---------|---------|----|-----------------------|
| <class> | integer | 33 | GPRS multislot class. |
|---------|---------|----|-----------------------|

Values:

1÷12 : class

30÷33 : class

| | | | |
|--------------|---------|---|---|
| <autoattach> | integer | 0 | specify when the new multislot class will be enabled. |
|--------------|---------|---|---|

Values:

0 : the new multislot class is enabled only at the next detach/attach or after a reboot.

1 : the new multislot class is enabled immediately, automatically forcing a detach / attach procedure only in case of GSM network registered

AT#MSCLASS?

Read command reports the current value of the multislot class in the format:

#MSCLASS: <class>

 **AT#MSCCLASS=?**

Test command reports the range of available values for both parameters `<class>` and `<autoattach>`.

3.14.6. AT#GAUTH - PPP Data Connection Authentication Type

This command sets the authentication type used in PDP Context Activation during PPP-PS connections.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#GAUTH=[<type>]

Set command sets the authentication type used in PDP Context Activation during PPP-PS connections.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <type> | integer | 3 | authentication type used in PDP Context Activation during PPP-PS connections |

Values:

- 0 : no authentication
- 1 : PAP authentication
- 2 : CHAP authentication
- 3 : AUTO authentication (PAP or CHAP or no authentication according to host application)

- i** if the settings on the server side (the host application) of the PPP are not compatible with the **#GAUTH** setting, then the PDP Context Activation will use no authentication.

AT#GAUTH?

Read command reports the current authentication type, in the format:

#GAUTH: <type>

 **AT#GAUTH=?**

Test command returns the range of supported values for parameter <type>.

3.14.7. AT+CGAUTH - Define PDP Context Authentication Parameters

This command allows the TE to specify authentication parameters for a PDP context.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CGAUTH=<cid>,<auth_type>,<username>,<password>

Set command allows the TE to specify authentication parameters for a PDP context identified by the (local) context identification parameter <cid>, used during the PDP context activation and the PDP context modification procedures.

Parameters:

| Name | Type | Default | Description |
|-------------------------|---------|---------|---|
| <cid> | integer | - | specifies a particular PDP context definition, see the +CGDCONT command. |
| <auth_type> | integer | 0 | selects the authentication protocol used for this PDP context. |
| Values: | | | |
| 0 : no authentication | | | |
| 1 : PAP authentication | | | |
| 2 : CHAP authentication | | | |
| <username> | string | - | User name for access to the IP network |
| <password> | string | - | Password for access to the IP network |

AT+CGAUTH?

Read command returns the PDP authentication parameters, excluding **<password>**, for every defined PDP context, in the format:

```
+CGAUTH: <cid1>,< auth_type1 >,<username1><CR><LF>
```

...

```
+CGAUTH:<cid_max>,<auth_type_max>,<username_max><CR><LF>
```

AT+CGAUTH=?

Test command reports the supported range of values for parameters **<cid>**, **<auth_type>** and the maximum lengths for parameters **<username>** and **<password>**.

3.14.8. AT+CGCONTRDP - PDP Context Read Dynamic Parameters

The execution command returns the relevant information for a PDP Context established by the network.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT+CGCONTRDP[=<cid>]

The execution command returns the relevant information on a PDP Context established by the network with the context identifier <cid>. If the parameter <cid> is omitted, the information for all established PDP contexts is returned. The response message has the following format:

```
+CGCONTRDP:<cid>,<bearerId>,<apn>[,<ip&subnet>[,<gw_addr>[,<DNS_prim>
[,<DNS_sec>[, <P_CSCF_prim>[,<P_CSCF_sec>]]]]]]][<CR><LF>
+CGCONTRDP:<cid>,<bearerId>,<apn>[,
<ip&subnet_mask>[,<gw_addr>[,<DNS_prim>
[,<DNS_sec>[, <P_CSCF_prim>[,<P_CSCF_sec>]]]]]] [...]]
```

If the context cannot be found an **ERROR** response is returned.

The response message parameters are described in the Additional info section.

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <cid> | integer | - | identifies a non secondary PDP context definition. The parameter is local to the TE-MT interface and is used in other PDP context-related commands. |

Additional info:

- List of the meaning of the response message parameters.

| Name | Type | Default | Description |
|---------------|---------|---------|--|
| <bearerId> | integer | - | identifies the bearer, EPS Bearer in EPS and NSAPI in UMTS/GPRS. |
| <apn> | string | - | logical name used to select the GGSN or the external packet data network. |
| <ip&subnet> | string | - | IP address and subnet mask of the MT. The string is given as dot-separated numeric (0-255) parameters on the form. For more information, see next Additional info section. |
| <gw_addr> | string | - | Gateway address of the MT. The string is given as dot-separated numeric (0-255) parameters. |
| <DNS_prim> | string | - | IP address of the primary DNS Server. |
| <DNS_sec> | string | - | IP address of the secondary DNS Server. |
| <P_CSCF_prim> | string | - | IP address of the primary P-CSCF Server. |
| <P_CSCF_sec> | string | - | IP address of the secondary P-CSCF Server. |

- Referring to <ip&subnet> parameter:
the string is given as dot-separated numeric (0-255) parameters. The format is:

for IPv4:

"a1.a2.a3.a4.m1.m2.m3.m4"

for IPv6:

```
"a1.a2.a3.a4.a5.a6.a7.a8.a9.a10.a11.a12.a13.a14.a15.a16.  
m1.m2.m3.m4.m5.m6.m7.m8.m9.m10.m11.m12. m13.m14.m15.m16"
```

When **+CGPIAF** is supported, its settings can influence the format of this parameter returned with the execute form of **+CGCONTRDP**.

- i** The dynamic part of the PDP context will only exist if established by the network. The test command returns a list of **<cid>**s associated with active contexts.
- i** If the MT has dual stack capabilities, two lines of information are returned per **<cid>**. First one line with the IPv4 parameters followed by one line with the IPv6 parameters.

AT+CGCONTRDP=?

Return the list of **<cid>**s associated with active contexts.

3.14.9. AT+CGPIAF - Printing IP Address Format

This command selects the printout format of the IPv6 address.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT+CGPIAF=[<IPv6_AddressFormat>[,<IPv6_SubnetNotation>[,<IPv6_LeadingZeros> [,<Pv6_CompressZeros>]]]]**

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|---|
| <IPv6_AddressFormat> | integer | 0 | selects the IPv6 address format. Relevant for all AT command parameters that can hold an IPv6 address. |
| <p>Values:</p> <p>0 : use IPv4-like dot-notation. IP addresses, and subnetwork mask if applicable, are dot-separated.</p> <p>1 : use IPv6-like colon-notation. IP address, and subnetwork mask if applicable and when given explicitly, are separated by a space.</p> | | | |
| <IPv6_SubnetNotation> | integer | 0 | selects the subnet-notation for remote address and subnet mask. Setting does not apply if IPv6 address format <IPv6_AddressFormat>=0. |

Values:

- 0 : both IP address, and subnet mask are started explicitly, separated by a space.
- 1 : the printout format is applying /(forward slash) subnet-prefix Classless Inter-Domain Routing (CIDR) notation.

| | | | |
|----------------------------------|---------|---|---|
| <IPv6_LeadingZeros> | integer | 0 | selects whether leading zeros are omitted or not. Setting does not apply if IPv6 address format <IPv6_AddressFormat>=0 . |
|----------------------------------|---------|---|---|

Values:

- 0 : leading zeros are omitted.
- 1 : leading zeros are included.

| | | | |
|----------------------------------|---------|---|--|
| <Pv6_CompressZeros> | integer | 0 | selects whether 1-n instances of 16-bit- zero values are replaced by only ":". This applies only once. Setting does not apply if IPv6 address format <IPv6_AddressFormat>=0 . |
|----------------------------------|---------|---|--|

Values:

- 0 : no zero compression.
 - 1 : use zero compression.
-

 **AT+CGPIAF?**

Read command returns the current parameter setting.

 **AT+CGPIAF=?**

Test command returns values supported as compound values.

```
</> AT+CGPIAF=0,0,0,0  
OK
```

```
AT#SGACT=1,1  
#SGACT: 252.1.171.171.205.205.239.224.0.0.0.0.0.0.1  
OK
```

```
AT+CGPIAF=1,0,0,0  
OK
```

```
AT#SGACT=1,1  
#SGACT: FC01:ABAB:CD:CD:EF:0:0:0:0:1  
OK
```

3.14.10. AT+CGACT - PDP Context Activate or Deactivate

This command activates or deactivates the specified PDP context(s).

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CGACT=[<state>[,<cid>[,<cid>][,...]]]

Parameters:

| Name | Type | Default | Description |
|---------|---------|------------|---|
| <state> | integer | N/A | activate/deactivate the PDP context |
| Values: | | | |
| 0 | : | deactivate | |
| 1 | : | activate | |
| <cid> | integer | - | specifies a PDP context definition (see +CGDCONT command) |

- i** Only three <cid>s can be activated at the same time.
- i** if no <cid>s are specified, the activation form of the command activates the first three defined contexts. The deactivation form deactivates all the active contexts.

AT+CGACT?

Read command returns the current activation state for all the defined PDP contexts in the format:

```
+CGACT: <cid>,<state>[<CR><LF>
+CGACT: <cid>,<state>[...]]
```

AT+CGACT=?

Test command reports information on the supported PDP context activation states **<state>**.

```
</> AT+CGACT=1,1
OK
```

```
AT+CGACT?
+CGACT: 1,1
OK
```

3.14.11. AT+CGEREP - Packet Domain Event Reporting

This command enables or disables the presentation of unsolicited result codes.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Required | Specific profile | No | - | 2 |

AT+CGEREP=[<mode>[,<bfr>]]

Set command enables/disables sending of unsolicited result codes in case of certain events occurring in the module or in the network. The URC formats and related events are shown in the Additional info sections.

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | 0 | controls the processing of URCs specified with this command. |

Values:

- 0 : buffer unsolicited result codes in the TA. If TA result code buffer is full, the oldest one can be discarded. No codes are forwarded to the TE.
- 1 : discard unsolicited result codes when TA-TE link is reserved (e.g. in on-line data mode); otherwise forward them directly to the TE.
- 2 : buffer unsolicited result codes in the TA when TA-TE link is reserved (e.g. in on-line data mode) and flush them to the TE when TA-TE link becomes available; otherwise forward them directly to the TE.

| | | | |
|--------------------|---------|---|---|
| <bfr> | integer | 0 | controls the effect on buffered codes when <mode> 1 or 2 is entered. |
|--------------------|---------|---|---|

Values:

- 0 : TA buffer of unsolicited result codes defined within this command is cleared when **<mode>** 1 or 2 is entered.
- 1 : TA buffer of unsolicited result codes defined within this command is flushed to the TE when **<mode>** 1 or 2 is entered (OK response shall be given before flushing the codes)

Unsolicited fields:

| Name | Type | Description |
|-------------------------|---------|---|
| <PDP_type> | string | Packet Data Protocol type, which specifies the type of packet data protocol |
| <PDP_addr> | string | identifies the terminal in the address space applicable to the PDP |
| <cid> | integer | PDP Context Identifier |

AT+CGEREP?

Read command returns the current **<mode>** and **<bfr>** settings, in the format:

+CGEREP: <mode>,<bfr>

AT+CGEREP=?

Test command reports the supported range of values for the **+CGEREP** command parameters.

Here are some examples:

- A network request for PDP context activation occurred when the TA was unable to report it to the TE with a **+CRING** unsolicited result code and was automatically rejected.

+CGEV: REJECT <PDP_type>, <PDP_addr>

- The network has requested a context reactivation. The **<cid>** that was used to reactivate the context is provided if known to TA.

+CGEV: NW REACT <PDP_type>, <PDP_addr>, [<cid>]

- The network has forced a context deactivation. The **<cid>** that was used to activate the context is provided if known to TA.

+CGEV: NW_DEACT <PDP_type>, <PDP_addr>, [<cid>]

- The mobile equipment has forced a context deactivation. The **<cid>** that was used to activate the context is provided if known to TA.

+CGEV: ME_DEACT <PDP_type>, <PDP_addr>, [<cid>]

- The mobile equipment has forced a PS detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: ME_DETACH

- The network has forced a PS detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: NW_DETACH

3.14.12. AT#PPPCFG - PPP Configuration

This command configures the PPP mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#PPPCFG=<mode>

Set command sets the active/passive PPP mode

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------|
| <mode> | integer | 1 | sets PPP mode |

Values:

0 : passive mode

1 : active mode

AT#PPPCFG?

Read command returns the current <mode>, in the format:

#PPPCFG: <mode>

AT#PPPCFG=?

Test command returns the range of available values for parameters <mode> .

3.14.13. AT+CGREG - GPRS Network Registration Status

Set command controls the presentation of the **+CGREG**: unsolicited result code

3GPP TS 27.007

3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CGREG=[<mode>]

Set command enables/disables the **+CGREG**: unsolicited result code, and selects one of the available formats:

short format:

+CGREG:<stat>

long format:

+CGREG:<stat>[,<lac>,<ci>[,<AcT>,<rac>]]

extra long format:

+CGREG:<stat>[, [<lac>], [<ci>], [<AcT>], [<rac>][, [, [<ActiveTime>], [<PeriodicRAU>], [<GPRSREADYtimer>]]]]

Parameter:

| Name | Type | Default | Description |
|---------------------|---------|---------|--|
| <mode> | integer | 0 | <p>enables/disables the network registration unsolicited result code (URC), and selects one of the available formats.</p> <p>The following events triggers the URC:</p> <p>51. URC short format is displayed every time there is a change in the network registration status</p> |

-
52. URC long or extra long format is displayed, according to **<mode>** value, every time there is a change of the network cell.

Values:

- 0 : disable the network registration unsolicited result code
 - 1 : enable the network registration unsolicited result code, and selects the short format
 - 2 : enable the network registration unsolicited result code, and selects the long format (includes the network cell identification data)
 - 4 : enable the network registration and location information unsolicited result code (extra long format)
-

Unsolicited fields:

| Name | Type | Description |
|---------------------|---------|---|
| <stat> | integer | registration status of the module |
| | | Values: |
| | | 0 : not registered, terminal is not currently searching a new operator to register to |
| | | 1 : registered, home network |
| | | 2 : not registered, but terminal is currently searching a new operator to register to |
| | | 3 : registration denied |
| | | 4 : unknown |
| | | 5 : registered, roaming |
| <lac> | string | the parameter reports: 53. Local Area Code when <AcT> =0 |

| | | |
|-------------------------------|---------|---|
| | | 54. Tracking Area Code when <AcT> =8 or 9 |
| <ci> | string | cell ID in hexadecimal format |
| <AcT> | integer | access technology of the registered network. Values: 0 : GSM 8 : CAT M1 9 : NB IoT |
| <rac> | string | routing area code (one byte) in hexadecimal format |
| <ActiveTime> | string | one byte in an 8 bit format. Indicates the Active Time value (T3324) allocated to the UE. The Active Time value is coded as one byte (octet 3) of the GPRS Timer 2 information element coded as bit format (e.g. "00100100" equals 4 minutes). For the coding and the value range, see the GPRS Timer 2 IE in 3GPP TS 24.008. |
| <PeriodicRAU> | string | one byte in an 8 bit format. Indicates the extended periodic RAU value (T3312) allocated to the UE. The extended periodic RAU value is coded as one byte (octet 3) of the GPRS Timer 3 information element coded as bit format (e.g. "01000111" equals 70 hours). For the coding and the value range, see the GPRS Timer 3 IE in 3GPP TS 24.008. |
| <GPRSREADYtimer> | string | one byte in an 8 bit format. Indicates the GPRS READY timer value (T3314) allocated to the UE. The GPRS READY timer value is coded as one byte (octet 2) of the GPRS Timer information element coded as bit format (e.g. "01000011" equals 3 decihours or 18 minutes). For the coding and the value range, see the GPRS Timer IE in 3GPP TS 24.008. |

-
-  **<lac>**, **<ci>**, **<AcT>**, and **<rac>** network information is reported by URC only if **<mode>**=2 or 4, and the module is registered on some network cell.
-

AT+CGREG?

Read command returns the current value of **<mode>**, the registration status **<stat>**, and the network information (**<lac>**, **<ci>**, **<AcT>**, and **<rac>**) according to the used **<mode>** parameter value.

+CGREG: <mode>,<stat>[,<lac>,<ci>[,<AcT>,<rac>]]

<lac>, **<ci>**, **<AcT>**, and **<rac>** network information is reported only if **<mode>**=2 or 4 and the module is registered on some network cell.

AT+CGREG=?

Test command returns supported values for parameter **<mode>**.

3.14.14. AT+CGATT - PS Attach or Detach

This execution command is used to register (attach) the terminal to or deregister (detach) the terminal from the Packet Domain service.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CGATT=<state>

Parameter:

| Name | Type | Default | Description |
|---------|---------|---------|------------------------|
| <state> | integer | N/A | state of PS attachment |

Values:

0 : detached

1 : attached

AT+CGATT?

Read command returns the current PS state in the format:

+CGATT: <state>

AT+CGATT=?

Test command returns the values range of the <state> parameter.

```
AT+CGATT?  
+CGATT: 0  
OK
```

```
AT+CGATT=?  
+CGATT: (0,1)  
OK
```

```
AT+CGATT=1  
OK
```

3.14.15. AT+CSODCP - Sending of Originating Data Via the Control Plane

The set command is used by the TE to transmit data over control plane to network via MT. Context identifier **<cid>** is used to link the data to particular context.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT+CSODCP=<cid>,<cpdataLength>,<cpdata>,<RAI>[,<typeOfUserData>]**

Parameters:

| Name | Type | Default | Description |
|-----------------------------|---------|---------|---|
| <cid> | integer | - | specifies a particular PDP context or EPS bearer context definition. The <cid> parameter is local to the TE-MT interface and identifies the PDP or EPS bearer contexts which have been setup via AT command (see the +CGDCONT and +CGDSCONT commands) |
| <cpdataLength> | integer | - | indicates the number of octets of the <cpdata> information element. When there is no data to transmit, the value shall be set to zero. |
| <cpdata> | string | - | is a string of octets. Contains the user data container contents. When there is no data to transmit, the <cpdata> shall be an empty string (""). This parameter shall not be subject to conventional character conversion as per +CSCS . The coding format of the user data container and the maximum |

length of **<cpdata>** are implementation specific.

| | | | |
|--------------------|---------|---|--|
| <RAI> | integer | 0 | indicates the value of the release assistance indication |
|--------------------|---------|---|--|

Values:

- 0 : no information available
- 1 : the MT expects that exchange of data will be completed with the transmission of the ESM DATA TRANSPORT message
- 2 : the MT expects that exchange of data will be completed with the receipt of an ESM DATA TRANSPORT Message

| | | | |
|-------------------------------|---------|---|---|
| <typeOfUserData> | integer | 0 | indicates whether the user data that is transmitted is regular or exceptional |
|-------------------------------|---------|---|---|

Values:

- 0 : regular data
- 1 : exception data

AT+CSODCP=?

Test command reports the supported range of values for parameters: **<cid>**, **<cpdataLength>**, **<RAI>** and **<typeOfUserData>**.

3.14.16. AT+CRTDCP - Reporting of Terminating Data Via the Control Plane

The set command is used to enable and disable reporting of data from the network to the MT that is transmitted via the control plane in downlink direction.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT+CRTDCP=[<reporting>]

If reporting is enabled, the MT returns the following unsolicited result code when data is received from the network.

+CRTDCP: <cid>,<cpdataLength>,<cpdata>

Parameter:

| Name | Type | Default | Description |
|-------------|---------|---------|--|
| <reporting> | integer | 0 | controlling reporting of mobile terminated control plane data events |

Values:

- 0 : disable reporting of MT control plane data
- 1 : enable reporting of MT control plane data by the unsolicited result code +CRTDCP

Unsolicited fields:

| Name | Type | Description |
|----------------|---------|---|
| <cid> | integer | specifies a particular PDP context or EPS bearer context definition. The <cid> parameter is local to the TE-MT interface and identifies the PDP or EPS bearer contexts which have been setup via AT command (see the +CGDCONT and +CGDSCONT commands) |
| <cpdataLength> | integer | indicates the number of octets of the <cpdata> information element |

| | | |
|-----------------------|--------|---|
| <cpdata> | string | is a string of octets. Contains the user data container contents. This parameter shall not be subject to conventional character conversion as per +CSCS . The coding format of the user data container and the maximum length of <cpdata> are implementation specific |
|-----------------------|--------|---|

AT+CRTDCP?

Read command returns the current parameter setting for **+CRTDCP** command in the format:

+CRTDCP: <reporting>

AT+CRTDCP=?

Test command reports the supported range of values for parameter **<reporting>**, and range of supported **<cid>** and **<cpdataLength>**.

3.15. IPEasy

3.15.1. AT#SGACT - Context Activation

This command enables/disables the PDP context activation.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SGACT=<cid>,<stat>[,<userId>[,<pwd>]]

Execution command is used to activate the specified PDP context, followed by binding data application to the PS network. Also, it is used to deactivate the PDP context and unbind data application from PS network.

Execution command returns a list of IP addresses for the specified context identifiers in the format:

for IP or IPV6 PDP context: **#SGACT: <ipAddr>**

for DUAL STACK IPV4V6 PDP context: **#SGACT: [<ipAddrV4>],[<ipAddrV6>]**

Parameters:

| Name | Type | Default | Description |
|---------------------|---------|---------|---|
| <cid> | integer | - | specifies a particular PDP context definition. To know the range see +CGDCONT command. |
| <stat> | integer | 0 | activates/disactivates the PDP context specified |

Values:

0 : deactivate the context

1 : activate the context

| | | | |
|----------|--------|---|---|
| <userId> | string | - | user identifier, used only if the context requires it |
| <pwd> | string | - | password, used only if the context requires it |

Additional info:

- ▶▶ Meaning of the parameters returned by the command.

| Name | Type | Default | Description |
|------------|--------|---------|---|
| <ipAddr> | string | - | ip address ipv4 or ipv6 |
| <ipAddrV4> | string | - | ip address ipv4 (if v4 PDP context activated) |
| <ipAddrV6> | string | - | ip address ipv6 (if v6 PDP context activated) |

- i** Context activation/deactivation returns **ERROR** if there is not any socket associated to it, see **#SCFG**.
- i** In LTE network, default PDP context (<cid>=1) is activated by piggybacking on LTE attach procedure and maintained until detached from network. This command with <cid>=1 is just binding or unbinding application to the default PDP context.
- i** If the unsolicited result code for obtaining IP address was enabled (urcmode value) using **#SGACTCFG** command, on start up and due to USB enumeration timing the unsolicited may not appear, user should manually use **+CGPADDR** command to see the IP address.
- i** **#SCFG=x,0** will close all unclosed **AT#SD** sockets on <cid>=x.

AT#SGACT?

Read command returns the state of all the contexts that have been defined in the format:

#SGACT: <cid₁>,<stat₁><CR><LF>

...

#SGACT: <cid_n>,<stat_n>

-  Each row in the read command's answer is optional.

 AT#SGACT=?

Test command reports the range for the parameters <cid> and <stat>.

3.15.2. AT#SGACTAUTH - PDP Context Authentication Type

This command sets the authentication type for IP Easy

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SGACTAUTH=<type>

Set command sets the authentication type for IP Easy, it has effect on the authentication mode used by #SGACT command.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------------------|
| <type> | integer | 1 | authentication type for IP Easy |

Values:

- 0 : no authentication
- 1 : PAP authentication
- 2 : CHAP authentication

AT#SGACTAUTH?

Read command reports the current IP Easy authentication type, in the format:

#SGACTAUTH: <type>

AT#SGACTAUTH=?

Test command returns the supported values for parameter <type>.

3.15.3. AT#SGACTCFG - PDP Automatic Context Activation-Reactivation

This command configures the automatic activation/reactivation of the specified PDP context

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SGACTCFG=<cid>,<retry>[,<delay>[,<urcmode>]]

Set command enables/disables the automatic activation/reactivation of the specified PDP context, sets the maximum number of attempts and the delay between an attempt and the next one. The context is automatically activated after every PS attach or after a network PDP context deactivation if at least one IPEasy socket is configured for that context, see #SCFG command.

Parameters:

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <cid> | integer | - | PDP context identifier. To know the range see +CGDCONT command. |
| <retry> | integer | 0 | specifies the maximum number of context activation attempts in case of activation failure. 0 disables the automatic activation/reactivation of the context. It is the default value if the set command is not used, see Example section. |

Value:

1÷15 : number of attempts.

| | | | |
|---------|---------|-----|--|
| <delay> | integer | 180 | specifies the delay in seconds between an attempt and the next one. 180 is the default value if the set command is not used, see Example section. |
|---------|---------|-----|--|

Value:

180÷3600 : delay in seconds

<urcmode> integer 0 URC presentation mode.

Values:

0 : disables URC

1 : enables URC, see Additional info section.

Additional info:

▶▶ <urcmode>=1

enables the URC after an automatic activation/reactivation of the local IP address obtained from the network. It has meaning only if <retry>≠0.

The format of the URC message is:

#SGACT: <ip_address>

Unsolicited field:

| Name | Type | Description |
|--------------|--------|---|
| <ip_address> | string | local IP address obtained from the network. |

- i** The URC presentation mode <urcmode> is related to the current AT instance only. Last <urcmode> setting is saved for every instance as extended profile parameter, thus it is possible to restore it even if the multiplexer control channel is released and set up, back and forth.
- i** < retry > and <delay> setting are global parameters saved in NVM.
- i** If the automatic activation is enabled on a context, then it is not allowed to modify by the command **#SCFG** the association between the context itself and the socket connection identifier; all the other

parameters of command **#SCFG** are modifiable while the socket is not connected.

AT#SGACTCFG?

Read command reports the states of all configured PDP contexts, in the format:

```
#SGACTCFG: <cid1>,<retry1>,<delay1>, < urcmode >CR><LF>
```

...

```
#SGACTCFG: <cidn>,<retryn>,<delayn>,< urcmode >
```

AT#SGACTCFG=?

Test command reports the values ranges of the parameters.

- `AT+CGDCONT=1,"IP","Access_Point_Name"`
OK

`AT+CGDCONT?`

`+CGDCONT: 1,"IP","Access_Point_Name","",0,0`
OK

`AT#SCFG=6,1,300,90,600,50`

OK

`AT#SCFG?`

`#SCFG: 1,1,300,90,600,50`

`#SCFG: 2,1,300,90,600,50`

`#SCFG: 3,1,300,90,600,50`

`#SCFG: 4,2,300,90,600,50`

`#SCFG: 5,2,300,90,600,50`

`#SCFG: 6,1,300,90,600,50`

OK

`AT#SGACTCFG?`

`#SGACTCFG: 1,0,180,0`

OK

`AT#SGACTCFG=1,15,3600,1`

OK

`AT#SGACTCFG?`

`#SGACTCFG: 1,15,3600,1`

OK

Reboot the module

`AT#SGACTCFG?`

`#SGACTCFG: 1,15,3600,0`

OK

3.15.4. AT#SGACTCFGEXT - Extended PDP Context Configuration

This command manages the extended configuration of context activation.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SGACTCFGEXT=<cid>,<abortAttemptEnable>[,<unused>[,<unused>[,<unused>]]]**

Set command is used to enable new features related to context activation.

Parameters:

| Name | Type | Default | Description |
|----------------------|---------|---------|--|
| <cid> | integer | - | PDP context identifier. To know the range see +CGDCONT command. |
| <abortAttemptEnable> | integer | 0 | enables/disables abort during context activation attempt. |

Values:

- 0 : old behavior: no abort possible while attempting context activation
- 1 : abort during context activation attempt is possible by sending a byte on the serial port

| | | | |
|-----------------|-------|-----|------------------|
| <unused> | mixed | N/A | unused parameter |
| Value: | | | |
| 0 : dummy value | | | |
| <unused> | mixed | N/A | unused parameter |
| Value: | | | |

0 : dummy value

<unused> mixed N/A unused parameter

Value:

0 : dummy value

- i** <abortAttemptEnable>=1 takes effect on successive PDP context activation attempt through **#SGACT** command. While waiting for **AT#SGACT=<cid>,1** response, it is possible to abort attempt by sending a byte and get back AT interface control (**NO CARRIER** indication).
- i** If we receive delayed **CTXT ACTIVATION ACCEPT** after abort, network will be automatically informed of our aborted attempt through relative protocol messages (**SM STATUS**) and will also close on its side. Otherwise, if no **ACCEPT** is received after abort, network will be informed later of our PDP state through other protocol messages (routing area update for instance).
- i** The command is not effective while the context is already open.

AT#SGACTCFGEXT?

Read command reports the state of all the five contexts, in the format:

```
#SGACTCFGEXT: <cid1>,< abortAttemptEnable1 >,0,0,0<CR><LF>
```

...

```
#SGACTCFGEXT: <cidn>,< abortAttemptEnablen >,0,0,0<CR><LF>
```

AT#SGACTCFGEXT=?

Test command reports supported range of values for all parameters.

- See #SGACTCFG command
AT#SGACTCFG?
#SGACTCFG: 1,15,3600,0
OK

```
AT#SGACTCFGEXT?  
#SGACTCFGEXT: 1,0,0,0,0  
OK
```

```
AT#SGACTCFGEXT=1,1,0,0,0  
OK
```

```
AT#SGACTCFGEXT?  
#SGACTCFGEXT: 1,1,0,0,0  
OK
```

Reboot the module

```
AT#SGACTCFGEXT?  
#SGACTCFGEXT: 1,1,0,0,0  
OK
```

3.15.5. AT#SCFG - Socket Configuration

The command sets the configuration for the socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SCFG=<connId>,<cid>,<pktSz>,<maxTo>,<connTo>,<txTo>**

Set command sets the socket configuration parameters.

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|------------------------------------|--|
| <connId> | integer | N/A | Socket connection identifier. |
| Value: | | | |
| 1÷6 | : | Socket connection identifier value | |
| <cid> | integer | - | PDP context identifier. To know the range see +CGDCONT command. |
| <pktSz> | integer | 300 | Packet size in bytes to be used by the TCP/UDP/IP stack for data sending. |
| Values: | | | |
| 0 | : | select automatically default value | |
| 1÷1500 | : | packet size in bytes | |
| <maxTo> | integer | 90 | Exchange timeout in seconds (or socket inactivity timeout); if there's no data exchange within this timeout period the connection is closed. |
| Values: | | | |
| 0 | : | no timeout | |

1÷65535 : timeout

| | | | |
|-----------------------|---------|-----|--|
| <connTo> | integer | 600 | Connection timeout in tenths of seconds. If we cannot establish a connection to the remote within this timeout period, an error is raised. |
|-----------------------|---------|-----|--|

Values:

0 : no timeout

10÷1200 : timeout value in hundreds of milliseconds

| | | | |
|---------------------|---------|----|--|
| <txTo> | integer | 50 | data sending timeout; data are sent even if they are less than max packet size, after this period. Used for online data mode only. |
|---------------------|---------|----|--|

Values:

0 : no timeout

1÷255 : timeout in tenths of seconds

256 : timeout value of 10 ms

257 : timeout value of 20 ms

258 : timeout value of 30 ms

259 : timeout value of 40 ms

260 : timeout value of 50 ms

261 : timeout value of 60 ms

262 : timeout value of 70 ms

263 : timeout value of 80 ms

264 : timeout value of 90 ms

AT#SCFG?

Read command returns the current socket configuration parameters values for all the six sockets, in the format:

```
#SCFG:
<connld1>,<cid1>,<pktsz1>,<maxTo1>,<connTo1>,<txTo1><CR><LF>
#SCFG:
<connld2>,<cid2>,<pktsz2>,<maxTo2>,<connTo2>,<txTo2><CR><LF>
...
#SCFG: <connld6>,<cid6>,<pktsz6>,<maxTo6>,<connTo6>,<txTo6>
```

AT#SCFG=?

Test command returns the range of supported values for all the parameters.

Example of test command.

- AT#SCFG?
#SCFG: 1,1,300,90,600,50
#SCFG: 2,2,300,90,600,50
#SCFG: 3,2,250,90,600,50
#SCFG: 4,1,300,90,600,50
#SCFG: 5,1,300,90,600,50
#SCFG: 6,1,300,90,600,50
OK

3.15.6. AT#SCFGEXT - Socket Configuration Extended

This command sets the socket configuration extended parameters.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SCFGEXT=<connId>,<srMode>,<recvDataMode>,<keepalive>[,<ListenAutoRsp> [,<sendDataMode>]]**

Set command sets the socket configuration extended parameters.

Parameters:

| Name | Type | Default | Description |
|-----------------------------|----------|---------|---|
| <connId> | integer | 1 | socket connection identifier |
| | Value: | | |
| | 1÷conMax | : | socket connection identifier. conMax value is returned by test command |
| <srMode> | integer | 0 | SRING unsolicited mode, see Additional info section. |
| | Values: | | |
| | 0 | : | Normal |
| | 1 | : | Data amount |
| | 2 | : | Data view |
| | 3 | : | Data view with UDP datagram information |
| <recvDataMode> | integer | 0 | Data view mode for received data in command mode (#SRECV or <srMode> = 2) |
| | Values: | | |

0 : Text mode

1 : Hexadecimal mode

| | | | |
|--------------------------|---------|---|--|
| <keepalive> | integer | 0 | Set the TCP Keepalive value in minutes |
|--------------------------|---------|---|--|

Values:

0 : deactivated

1÷240 : keepalive time in minutes

| | | | |
|------------------------------|---------|---|---|
| <ListenAutoRsp> | integer | 0 | set the listen auto-response mode, that affects the commands #SL and #SLUDP |
|------------------------------|---------|---|---|

Values:

0 : deactivated

1 : activated

| | | | |
|-----------------------------|---------|---|---|
| <sendDataMode> | integer | 0 | Data mode for sending data in command mode (#SEND) |
|-----------------------------|---------|---|---|

Values:

0 : data represented as text

1 : Data represented as sequence of hexadecimal numbers (from 00 to FF). Each octet of the data is given as two IRA character long.

Additional info:

►► These are the **SRING** formats, depending on **<srMode>** setting:

if **<srMode>** = 0 (Normal):

SRING: **<connId>**

if **<srMode>** = 1 (Data amount):

SRING: **<connId>,<recData>**

if **<srMode>** = 2 (Data view):

SRING: **<connId>**,**<recData>**,**<data>**

if **<srMode>** = 3 (Data view with UDP datagram information):

SRING: **<sourceIP>**,**<sourcePort>**,**<connId>**,**<recData>**,**<dataLeft>**,**<data>**

| Name | Type | Default | Description |
|---------------------------|---------|---------|---|
| <recData> | integer | - | amount of data received on the socket connection number <connId> |
| <data> | mixed | - | data received displayed following <recvDataMode> value |
| <sourceIP> | string | - | IP address of the source of data |
| <sourcePort> | string | - | IP port of the source of data |
| <dataLeft> | integer | - | number of bytes left in the UDP datagram |

-  Keepalive is available only on TCP connections.
-  For the behavior of **#SL** and **#SLUDP** in case of auto response mode or in case of no auto response mode, see the description of the two commands.

AT#SCFGEXT?

Read command returns the current socket extended configuration parameters values for all the six sockets, in the format:

```
#SCFGEXT: <connId1>,  
<srMode>,<dataMode>,<keepalive>,<ListenAutoRsp>,0<CR><LF>  
...  
#SCFGEXT:<connIdconMax>,<srMode>,<dataMode>,<keepalive>,  
<ListenAutoRsp>,0<CR><LF>
```

 **AT#SCFGEXT=?**

Test command returns the range of supported values for all the sub parameters.

- Socket 1 set with data view string, text data mode, a keepalive time of 30 minutes and listen auto-response set.
Socket 3 set with data amount string, hex recv data mode, no keepalive and listen auto-response not set.
Socket 4 set with hex recv and send data mode.

```
AT#SCFGEXT?  
#SCFGEXT: 1,2,0,30,1,0  
#SCFGEXT: 2,0,0,0,0,0  
#SCFGEXT: 3,1,1,0,0,0  
#SCFGEXT: 4,0,1,0,0,1  
...  
...  
OK
```

3.15.7. AT#SCFGEXT2 - Socket Configuration Extended 2

Socket Configuration Extended.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#SCFGEXT2=<connId>,<bufferStart>[,<abortConnAttempt>[,<unused_B>[,<unused_C> [,<noCarrierMode>]]]]**

Set command sets the socket configuration extended parameters for features not included in **#SCFGEXT** command.

Parameters:

| Name | Type | Default | Description |
|---------------|---------|---------|---|
| <connId> | integer | N/A | socket connection identifier |
| Value: | | | |
| | 1÷max | : | socket connection identifier value (max value is returned by the Test command) |
| <bufferStart> | integer | 0 | select one of the two data sending timeout methods, the first one defined "old" the second one "new". The "old" data sending timeout method is set - by default - by #SCFG command, which sets also the <txTo> data sending timeout value. With #SCFGETXT2 command, you can set either the "old" or the "new" data sending timeout method. If the "new" method is selected, the "old" one is automatically disabled. |

The checking if new data have been received from serial port is done with a granularity that is directly related to **#SCFG <txTo>** setting with a maximum period of 1 sec.

Values:

- 0 : select "old" method: start transmission timer only first time if new data are received from the serial port
- 1 : select "new" method: restart transmission timer when new data is received from serial port

| | | | |
|---------------------------------|---------|---|---|
| <abortConnAttempt> | integer | 0 | enable the abort of an ongoing connection attempt started by #SD command and before the reception of the CONNECT message (in online mode) or OK message (in command mode). Values automatically saved in NVM. |
|---------------------------------|---------|---|---|

Values:

- 0 : not possible to interrupt connection attempt
- 1 : it is possible to interrupt the connection attempt (<connTo> set by #SCFG or DNS resolution running if required) and give back control to AT interface by reception of a character. As soon as the control given to the AT interface, the ERROR message will be received on the interface itself.

| | | | |
|-------------------------|---------|---|-------------------------|
| <unused_B> | integer | - | reserved for future use |
| <unused_C> | integer | - | reserved for future use |

| | | | |
|------------------------------|---------|---|---|
| <noCarrierMode> | integer | 0 | select the NO CARRIER message format received when the socket is closed. |
|------------------------------|---------|---|---|

Values:

- 0 : no additional information is attached to NO CARRIER message
 - 1 : NO CARRIER: <connId> message
 - 2 : NO CARRIER: <connId>, <cause> message. Refer to Additional info section
-

Additional info:

- ▶▶ **<noCarrierMode>=2** selects the following **NO CARRIER** message format:
NO CARRIER: <connId>, <cause>

| Name | Type | Default | Description |
|----------------------|---------|---------|---|
| <cause> | integer | - | is the socket disconnection cause. Refer to #SLASTCLOSURE command to know its values and meanings. |

- i** Is necessary to avoid overlapping of the two methods. Enabling new method, the old method for transmission timer (**#SCFG**) is automatically disabled to avoid overlapping.
 - i** Check if new data have been received from serial port is done with a granularity directly related to **<txTo>** parameter which is set by **#SCFG** command. The maximum period is 1 sec.
 - i** Like **#SLASTCLOSURE**, in case of subsequent consecutive closure causes received, the original disconnection cause indicated.
 - i** In the case of command mode connection and remote closure with subsequent inactivity timeout closure without retrieval of all available data
-

(#SRECV or SRING mode 2), it is indicated cause 1 for both possible FIN and RST from remote.

AT#SCFGEXT2?

Read command returns the current socket extended configuration of the six sockets. The format is:

```
#SCFGEXT2:<connId1>,<bufferStart1>,<abortConnAttempt1>,0,0,<noCarrierMode1>  
><CR><LF>
```

...

```
#SCFGEXT2:<connId6>,<bufferStart6>,<abortConnAttempt6>,0,0,<noCarrierMode6>  
<CR><LF>
```

AT#SCFGEXT2=?

Test command returns the range of supported values for all parameters.

- Set the new transmission timer behavior for `<connId>=1` and `<connId>=2` sockets.

```
AT#SCFGEXT2=1,1  
OK
```

```
AT#SCFGEXT2=2,1  
OK
```

Check the current extended configuration of the six sockets

```
AT#SCFGEXT2?  
#SCFGEXT2: 1,1,0,0,0,0  
#SCFGEXT2: 2,1,0,0,0,0  
#SCFGEXT2: 3,0,0,0,0,0  
#SCFGEXT2: 4,0,0,0,0,0  
#SCFGEXT2: 5,0,0,0,0,0  
#SCFGEXT2: 6,0,0,0,0,0  
OK
```

Check the current configuration of the six sockets

```
AT#SCFG?  
#SCFG: 1,1,300,90,600,50  
#SCFG: 2,1,300,90,600,50  
#SCFG: 3,1,300,90,600,50  
#SCFG: 4,2,300,90,600,50  
#SCFG: 5,2,300,90,600,50  
#SCFG: 6,2,300,90,600,50  
OK
```

Change the `<txTo>` data sending timeout of the `<connId>=1` socket.

```
AT#SCFG=1,1,300,90,600,30  
OK
```

3.15.8. AT#SKTRST - Socket Parameters Reset

Socket Parameters Reset

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

**AT#SKTRST**

Execution command resets the **#SCFG** socket parameters to the "factory default" configuration and stores them in the NVM of the device.

**AT#SKTRST=?**

Test command returns the **OK** result code.

Reset of the socket parameters

```
AT#SKTRST
```

```
OK
```

3.15.9. AT#SD - Socket Dial

Execution command opens a remote connection via socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

➡ **AT#SD=<connId>,<txProt>,<rPort>,<IPAddr>[,<closureType>[,<lPort>[,<connMode>[,<txTime>[,<userIpType>]]]]]**

Execution command opens a remote connection via socket.

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|---------|---|
| <connId> | integer | N/A | Socket connection identifier. |
| | Value: | | |
| | 1÷max | : | socket connection identifier value (max value is returned by the Test command) |
| <txProt> | integer | N/A | Transmission protocol. |
| | Values: | | |
| | 0 | : | TCP |
| | 1 | : | UDP |
| <rPort> | integer | N/A | Remote host port to contact. |
| | Value: | | |
| | 1÷65535 | : | remote host port number |
| <IPAddr> | string | - | IP address of the remote host: - any valid IP address in the format: "xxx.xxx.xxx.xxx" - any host name to be solved with a DNS query |

| | | | |
|----------------------------|---------|-----|---|
| | | | - any valid IPv6 address in the format: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx or xxx.xxx.xxx.xxx.xxx.xxx.xxx.xxx. xxx.xxx.xxx.xxx.xxx.xxx.xxx.xxx |
| <closureType> | integer | 0 | Socket closure behavior only for TCP when remote host has closed. The parameter has no effects for UDP connections. |
| | Values: | | |
| | 0 | : | local host closes immediately when remote host has closed |
| | 255 | : | local host closes after an escape sequence (+++) |
| <lPort> | integer | N/A | UDP connections local port <u>only for UDP</u> connections. The parameter has no effects for TCP connections. |
| | Value: | | |
| | 1÷65535 | : | UDP local port number |
| <connMode> | integer | 0 | Connection mode. |
| | Values: | | |
| | 0 | : | online mode connection |
| | 1 | : | command mode connection |
| <txTime> | integer | 0 | adjusting a time interval for series of UDP data packets will be uploaded. |
| | Values: | | |
| | 0 | : | Time interval is not requested |
| | 1÷1000 | : | Time interval in milliseconds |
| <userIpType> | integer | 0 | ip type for socket to open |
| | Values: | | |

- 0 : no ip type chosen
 - 1 : ipv4
 - 2 : ipv6
-

- i** **<userIpType>** parameter is only valid when **<IPAddr>** is domain name and dual stack connection is open by **#SGACT**.
When **<userIpType>** is "no ip type chosen" ipv6 will be requested firstly.
When ipv6 DNS server does not support so ipv4 will be requested.
- i** **<closureType>** parameter is valid for TCP connections only and has no effect (if used) for UDP connections.
- i** **<IPort>** parameter is valid for UDP connections only and has no effect (if used) for TCP connections
- i** If we set **<connMode>** to **online mode connection** and the command is successful we enter in **online data mode** and we see the intermediate result code **CONNECT**. After the **CONNECT** we can suspend the direct interface to the socket connection (N.B. the socket stays open) using the escape sequence (**+++**): the module moves back to **command mode** and we receive the final result code **OK** after the suspension.
After such a suspension, it is possible to resume it in every moment (unless the socket inactivity timer timeouts, see **#SCFG**) by using the **#SO** command with the corresponding **<connId>**.
- i** If we set **<connMode>** to **command mode connection** and the command is successful, the socket is opened, and we remain in **command mode** and we see the result code **OK**.
- i** If there are input data arrived through a connected socket and not yet read because the module entered **command mode** before reading them (after an escape sequence or after **#SD** has been issued with **<connMode>** set to **command mode connection**), these data are buffered and we receive the **SRING** URC (**SRING** presentation format depends on the last **#SCFGEXT** setting); it is possible to read these data afterwards issuing **#SRECV**. Under the same hypotheses it is possible to send data while in **command mode** issuing **#SEND**.
- i** **<txTime>** parameter is valid for UDP connections only and has no effect (if used) for TCP connections. For slow servers it is recommended to adjust

the time interval for uploading series of data packets in order to do not lose data. The following data packet will be sent after the previous data packet's time interval has been expired.

? AT#SD=?

Test command reports the range of values for all the parameters.

Examples of socket dial in online and command mode.

- Open socket 1 in online mode
`AT#SD=1,0,80,"www.google.com",0,0,0`

`CONNECT`

...

...

Open socket 1 in command mode

`AT#SD=1,0,80,"www.google.com",0,0,1`

`OK`

3.15.10. AT#SO - Socket Restore

Execution command resumes the direct interface to a socket connection which has been suspended by the escape sequence.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SO=<connId>

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|------------------------------|
| <connId> | integer | N/A | socket connection identifier |

Value:

1÷conMax : socket connection identifier. conMax value is returned by test command

AT#SO=?

Test command reports the range of values for <connId> parameter

3.15.11. AT#SH - Socket Shutdown

The set command closes a socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SH=<connId>

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <connId> | integer | N/A | socket connection identifier to be closed |

Value:

1÷conMax : socket connection identifier. conMax value is returned by test command

-  Socket cannot be closed in states "resolving DNS" and "connecting", see **#SS** command.

AT#SH=?

Test command reports the range for parameter <connId>

3.15.12. AT#SL - Socket Listen

The command opens/closes socket listening.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SL=<connId>,<listenState>,<listenPort>[,<lingerT>]

Set command opens/closes a socket listening for an incoming TCP connection on a specified port.

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|------------------------------|
| <connId> | integer | N/A | socket connection identifier |
| Value: | | | |
| 1÷6 : socket connection identifier | | | |
| <listenState> | integer | N/A | listening action |
| Values: | | | |
| 0 : close socket listening | | | |
| 1 : start socket listening | | | |
| <listenPort> | integer | N/A | local listening port |
| Value: | | | |
| 1÷65535 : local listening port value | | | |
| <lingerT> | integer | N/A | linger time |
| Values: | | | |
| 0 : immediate closure after remote closure | | | |

255 : local host closes only after an escape sequence (+++)

-  If successful, command returns a final result code **OK**. If the ListenAutoRsp flag has not been set through the command **#SCFGEXT** (for the specific <conId>), then, when a TCP connection request comes on the input port, if the sender is not filtered by internal firewall (see **#FRWL**), an URC is received:

+SRING : <conId>

Afterwards we can use **#SA** to accept the connection or **#SH** to refuse it.

If the ListenAutoRsp flag has been set, then, when a TCP connection request comes on the input port, if the sender is not filtered by the internal firewall (see **#FRWL**), the connection is automatically accepted: the **CONNECT** indication is given and the modem goes into **online data mode**.

If the socket is closed by the network the following URC is received:

#SKTL: ABORTED

AT#SL?

Read command returns all the actual listening TCP sockets.

AT#SL=?

Test command returns the range of supported values of the parameters.

Open a socket listening for TCP on port 3500.

```
AT#SL=1,1,3500
```

```
OK
```

3.15.13. AT#SLUDP - Socket Listen UDP

This command opens/closes a socket listening for an incoming UDP connection on a specified port.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT#SLUDP=<connId>,<listenState>,<listenPort>

Execution command opens/closes a socket listening for an incoming UDP connection on a specified port.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|---|
| <connId> | integer | N/A | socket connection identifier |
| Value: | | | |
| 1÷conMax : socket connection identifier. conMax value is returned by test command | | | |
| <listenState> | integer | 0 | indicates the action that will be performed |
| Values: | | | |
| 0 : closes socket listening | | | |
| 1 : starts socket listening | | | |
| <listenPort> | integer | 1 | local listening port |
| Value: | | | |
| 1÷65535 : available port numbers | | | |

-  If the ListenAutoRsp flag has not been set through the command **#SCFGEXT** (for the specific conId), then, when an UDP connection request comes on the input port, if the sender is not filtered by internal firewall (see **#FRWL**), an URC is received:

+SRING : <conId>

Afterwards we can use **#SA** to accept the connection or **#SH** to refuse it.

If the ListenAutoRsp flag has been set, then, when an UDP connection request comes on the input port, if the sender is not filtered by the internal firewall (see command **#FRWL**), the connection is automatically accepted: the **CONNECT** indication is given and the modem goes into online data mode.

If the socket is closed by the network the following URC is received:

#SLUDP: ABORTED

-  when closing the listening socket **<listenPort>** is a don't care parameter

AT#SLUDP?

Read command returns all the actual listening UDP sockets.

AT#SLUDP=?

Test command returns the range of supported values for all the sub parameters.

Next command opens a socket listening for UDP on port 3500.

```
AT#SLUDP=1,1,3500
OK
```

3.15.14. AT#SA - Socket Accept

Execution command accepts an incoming socket connection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#SA=<connId>[,<connMode>]**

Execution command accepts an incoming socket connection after an URC

SRING: <connId>

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|----------|---------|-----|-------------------------------|
| <connId> | integer | N/A | Socket connection identifier. |
|----------|---------|-----|-------------------------------|

Value:

1÷max : Socket connection identifier value (max is returned by the Test command)

| | | | |
|------------|---------|---|--|
| <connMode> | integer | 0 | Connection mode, as for command #SD . |
|------------|---------|---|--|

Values:

0 : online mode connection

1 : command mode connection

-  The **SRING** URC has to be a consequence of a **#SL** issue.
-  Setting the command before to having received a **SRING** will result in an **ERROR** indication, giving the information that a connection request has not yet been received.

 **AT#SA=?**

Test command reports the range of values for all the parameters.

3.15.15. AT#SSEND - Send Data in Command Mode

This command is used to send data through a connected socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SSEND=<connId>[,<Rai>]

Execution command permits, while the module is in command mode, to send data through a connected socket.

After entering **AT#SSEND=...** command, and terminated the command line with **<CR>**, the module returns the following four characters sequence prompt, and waits for data to send:

<CR><LF><greater_than><space> (see IRA character set: 13, 10, 62, 32)

To send the entered data, enter Ctrl-Z char (0x1A hex); to abort the operation enter ESC char (0x1B hex).

If data are successfully sent, the command returns **OK**. If data sending fails for some reason, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|--|
| <connId> | integer | N/A | Selection on which Socket connection identifier send data. |
| Value: | | | |
| 1÷10 : Socket connection identifier supported | | | |
| <Rai> | integer | 1 | RAI (Release Assistance Indication) configuration |
| Values: | | | |

- 1 : Set RAI to: "No further uplink or downlink data transmission subsequent to this transmission"
- 2 : Set RAI to: "Only a single downlink data transmission and no further uplink data transmissions subsequent to this transmission"

-  The maximum number of bytes to send is 1500 bytes; trying to send more data will cause the surplus to be discarded and lost.
-  It is possible to use **#SEND** only if the connection was opened by **#SD**, else the ME is raising an error.
-  A byte corresponding to BS char (0x08) is treated with its corresponding meaning; therefore previous byte will be cancelled (and BS char itself will not be sent).
-  RAI (Release Assistance Indication) is supported in NB-IoT only, otherwise is ignored.

AT#SEND=?

Test command returns the range of supported values for parameter **<connId>** and **<Rai>**.

 Send data through socket number 2
AT#SEND=2
>Test<CTRL-Z>
OK

3.15.16. AT#SENDEXT - Send Data in Command Mode extended

This command allows to send data through a connected socket including all possible octets (from 0x00 to 0xFF).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SENDEXT=<connId>,<bytesToSend>[,<Rai>]

Execution command permits, while the module is in command mode, to send data through a connected socket including all possible octets (from 0x00 to 0xFF).

After entering **AT#SENDEXT=...** command, and terminated the command line with **<CR>**, the module returns the following four characters sequence prompt, and waits for data to send:

<CR><LF><greater_than><space> (see IRA character set: 13, 10, 62, 32)

When **<bytesToSend>** bytes have been sent, operation is automatically completed.

If data are successfully sent, the command returns **OK**. If data sending fails for some reason, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|----------------------------|---------|---------|------------------------------|
| <connId> | integer | N/A | socket connection identifier |
| | Value: | | |
| | 1÷10 | : | socket connection identifier |
| <bytesToSend> | integer | N/A | number of bytes to be sent |
| | Value: | | |

1÷maxBytes : maxBytes is the maximum number of bytes that can be sent and it is reported by the test command

| | | | |
|-------|---------|-----|---|
| <Rai> | integer | N/A | RAI (Release Assistance Indication) configuration |
|-------|---------|-----|---|

Values:

- 1 : Set RAI to: "No further uplink or downlink data transmission subsequent to this transmission"
- 2 : Set RAI to: "Only a single downlink data transmission and no further uplink data transmissions subsequent to this transmission"

-  It's possible to use **#SSENDEXT** only if the connection was opened by **#SD**, else the modem returns an error.
-  All special characters are sent like a generic byte. For example, 0x08 is not interpreted as a BS (BackSpace) but it is simply sent through the socket.
-  RAI (Release Assistance Indication) is supported in NB-IoT only, otherwise is ignored.

AT#SSENDEXT=?

Test command returns the range of supported values for parameters <connId>, <bytesToSend> and <Rai>.

Open the socket in command mode:

```
AT#SD=1,0,<port>,"IP address",0,0,1
OK
```

Enter the command specifying total number of bytes as second parameter:

```
AT#SSENDEXT=1,256
```

```
> ..... ;      Terminal echo of bytes sent is displayed here
OK
```

All possible bytes (from 0x00 to 0xFF) are sent on the socket as generic bytes.

3.15.17. AT#SRECV - Socket Receive Data in Command Mode

The command permits the user to read data arrived through a connected socket when the module is in command mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SRECV=<connId>,<maxByte>[,<UDPInfo>]

Execution command permits the user to read data arrived through a connected socket but buffered and not yet read because the module entered command mode before reading them; the module is notified of these data by a **SRING:** URC, whose presentation format depends on the last **#SCFGEXT** setting.

Parameters:

| Name | Type | Default | Description |
|-----------|---------|--|---|
| <connId> | integer | NA | socket connection identifier |
| Value: | | | |
| 1÷conMax | : | socket connection identifier. conMax value is returned by test command | |
| <maxByte> | integer | NA | max number of bytes to read |
| Value: | | | |
| 1÷1500 | : | max number of bytes to read | |
| <UDPInfo> | integer | 0 | enables/disables the visualization of UDP datagram information. |
| Values: | | | |
| 0 | : | UDP information disabled | |
| 1 | : | UDP information enabled, see Additional info section. | |

Additional info:

- ▶▶ If <UDPInfo> is set to 1 (AT#SRECV=<connId>,<maxBytes>,1), the command returns a message having the following format:

#SRECV: <remoteIP>,<remotePort><connId>,<recData>,<dataLeft>

| Name | Type | Default | Description |
|--------------|---------|---------|----------------------------------|
| <remoteIP> | string | - | remote ip address |
| <remotePort> | string | - | remote port address |
| <recData> | integer | - | received data |
| <dataLeft> | integer | - | remaining bytes in the datagram. |

- ❗ Issuing #SRECV when there is no buffered data raises an error.

? AT#SRECV=?

Test command returns the range of supported values for parameters <connId> <maxByte> and <UDPInfo>.

3.15.18. AT#SSENDUDP - Send UDP Data to a Specific Remote Host

This command allows to send data over UDP to a specific remote host.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SSENDUDP=<connId>,<remoteIP>,<remotePort>[,<Rai>]

This command allows, while the module is in command mode, to send data over UDP to a specific remote host. UDP connection has to be previously completed with a first remote host through #SLUDP / #SA. Then, if module receives data from this or another host, it is able to send data to it. Like command #SEND, the device responds with ">" prompt and waits for the data to send.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|--|
| <connId> | integer | 1 | socket connection identifier |
| Value: | | | |
| 1÷10 : identifier number | | | |
| <remoteIP> | string | - | IP address of the remote host in dotted decimal notation, string type: "xxx.xxx.xxx.xxx" |
| <remotePort> | integer | 1 | remote host port |
| Value: | | | |
| 1÷65535 : host port number | | | |
| <Rai> | integer | N/A | RAI (Release Assistance Indication) configuration |
| Values: | | | |
| 1 : Set RAI to: "No further uplink or downlink data transmission subsequent to this transmission" | | | |

2 : Set RAI to: "Only a single downlink data transmission and no further uplink data transmissions subsequent to this transmission"

-  After **SRING** that indicates incoming UDP data and issuing **#SRECV** to receive data itself, through **#SS** is possible to check last remote host (IP/Port).
-  If successive resume of the socket to online mode is performed (**#SO**), connection with first remote host is restored as it was before.
-  RAI (Release Assistance Indication) is supported in NB-IoT only, otherwise is ignored.

AT#SSENDUDP=?

Test command reports the supported range of values for parameters **<connId>**, **<remoteIP>** and **<remotePort>** and **<Rai>**.

- Starts listening on <LocPort> (previous setting of firewall through #FRWL has to be done)

```
AT#SLUDP=1,1,<LocPort>
```

```
OK
```

```
SRING: 1          UDP data from a remote host available
```

```
AT#SA=1,1
```

```
OK
```

```
SRING: 1
```

```
AT#SI=1
```

```
#SI: 1,0,0,23,0    23 bytes to read
```

```
OK
```

```
AT#SRECV=1,23
```

```
#SRECV:1,23
```

```
message from first host
```

```
OK
```

```
AT#SS=1
```

```
#SS: 1,2,<LocIP>,<LocPort>,<RemIP1>,<RemPort1>
```

```
OK
```

```
AT#SENDUDP=1,<RemIP1>,<RemPort1>
```

```
>response to first host
```

```
OK
```

```
SRING: 1          UDP data from a remote host available
```

```
AT#SI=1
```

```
#SI: 1,22,23,24,0  24 bytes to read
```

```
OK
```

```
AT#SRECV=1,24
```

```
#SRECV:1,24
```

```
message from second host
```

```
OK
```

AT#SS=1

#SS: 1,2,<LocIP>,<LocPort>,<RemIP2>,<RemPort2>

OK

Remote host has changed, we want to send a response:

AT#SSENDUDP=1,<RemIP2>,<RemPort2>

>response to second host

OK

3.15.19. AT#SSENDUDPEXT - Send UDP Data to a Specific Remote Host EXTENDED

This command permits, while the module is in command mode, to send data over UDP to a specific remote host including all possible octets (from 0x00 to 0xFF)

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT#SSENDUDPEXT=<conId>,<bytestosend>,<remoteIP>,<remotePort>[,<Rai>]

Set command permits, while the module is in command mode, to send data over UDP to a specific remote host including all possible octets (from 0x00 to 0xFF).

As indicated about **#SSENDUDP**, UDP socket has to be previously opened through **#SLUDP** / **#SA**, then we are able to send data to different remote hosts.

Like **#SSENDEXT**, the device responds with the prompt '>' and waits for the data to send, operation is automatically completed when <bytestosend> have been sent.

Parameters:

| Name | Type | Default | Description |
|-------------------------------------|---------|---------|--|
| <conId> | integer | N/A | socket connection identifier |
| Value: | | | |
| 1÷10 : identifier number | | | |
| <bytestosend> | integer | N/A | bytes to be sent |
| Value: | | | |
| 1÷1500 : number of bytes to be sent | | | |
| <remoteIP> | string | - | IP address of the remote host in dotted decimal notation ("xxx.xxx.xxx.xxx") |
| <remotePort> | integer | N/A | remote host port |

Value:

1÷65535 : host port number

| | | | |
|--------------------|---------|-----|---|
| <Rai> | integer | N/A | RAI (Release Assistance Indication) configuration |
|--------------------|---------|-----|---|

Values:

- 1 : Set RAI to: "No further uplink or downlink data transmission subsequent to this transmission"
 - 2 : Set RAI to: "Only a single downlink data transmission and no further uplink data transmissions subsequent to this transmission"
-

RAI (Release Assistance Indication) is supported in NB-IoT only, otherwise is ignored.

? AT#SENDUDPEXT=?

Test command reports the supported range of values for parameters **<connId>**, **<bytesToSend>**, **<remoteIP>**, **<remotePort>** and **<Rai>**.

3.15.20. AT#SLASTCLOSURE - Detect the Cause of a Socket Disconnection

The command detects the cause of a socket disconnection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SLASTCLOSURE=<connId>

Execution command reports the socket disconnection cause.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|------------------------------|
| <connId> | integer | N/A | socket connection identifier |

Value:

1÷conMax : socket connection identifier. conMax value is returned by test command

Additional info:

- ▶ The execution command reports the disconnection cause of the selected socket. The format of the returned message is:

#SLASTCLOSURE: <connId>,<cause>

| Name | Type | Default | Description |
|---------|------|---------|-----------------------------|
| <cause> | hex | 0 | socket disconnection cause. |

Values:

0 : not available (socket has not yet been closed)

- 1 : remote host TCP connection close due to FIN/END: normal remote disconnection decided by the remote application
 - 2 : remote host TCP connection close due to RST, all other cases in which the socket is aborted without indication from peer (for instance because peer doesn't send ack after maximum number of retransmissions/peer is no more alive). All these cases include all the "FATAL" errors after recv or send on the TCP socket (named as different from EWOULDBLOCK)
 - 3 : socket inactivity timeout
 - 4 : network deactivation (PDP context deactivation from network)
 - 5 : DNS Error
-

- i** Any time socket is re-opened, last disconnection cause is reset. Command report 0 (not available).
- i** User closure cause (**#SH**) is not considered and if a user closure is performed after remote disconnection, remote disconnection cause remains saved and is not overwritten.
- i** If more consecutive closure causes are received, the original disconnection cause is saved.
(For instance: if a TCP FIN is received from remote and later a TCP RST because we continue to send data, FIN cause is saved and not overwritten)
- i** Also in case of `<closureType>` (**#SD**) set to 255, if the socket has not yet been closed by user after the escape sequence, **#SLASTCLOSURE** indicates remote disconnection cause if it has been received.
- i** In case of UDP, cause 2 indicates abnormal (local) disconnection. Cause 3 and 4 are still possible.
(Cause 1 is obviously never possible)

-
-  In case of command mode connection and remote closure with subsequent inactivity timeout closure without retrieval of all available data (**#SRECV** or **SRING** mode 2), it is indicated cause 1 for both possible FIN and RST from remote.
-

AT#SLASTCLOSURE=?

Test command reports the supported range for parameter **<connId>**

3.15.21. AT#SS - Socket Status

Execution command reports the current sockets status.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SS

Execution command reports the current sockets status using the following message format:

```
#SS: <connId>,<state>,<locIP>,<locPort>,<remIP>,<remPort><CR><LF>
[<connId>,<state>,<locIP>,<locPort>,<remIP>,<remPort><CR><LF>[...]]
```

Additional info:

- ▶▶ Parameters meaning.

| Name | Type | Default | Description |
|----------|---------|---------|------------------------------|
| <connId> | integer | - | socket connection identifier |
| <state> | integer | 0 | actual state of the socket |

Values:

- 0 : socket closed
- 1 : socket with an active data transfer connection
- 2 : socket suspended
- 3 : socket suspended with pending data
- 4 : socket listening

- 5 : socket with an incoming connection. Waiting for the user accept or shutdown command
- 6 : socket in opening process. The socket is not in Closed state but still not in Active or Suspended or Suspended with pending data state

| | | | |
|------------------------|---------|---|--|
| <locIP> | string | - | IP address associated by the context activation to the socket |
| <locPort> | integer | - | two meanings: 55. the listening port if we put the socket in listen mode 56. the local port for the connection if we use the socket to connect to a remote machine |
| <remIP> | string | - | when we are connected to a remote machine this is the remote IP address |
| <remPort> | string | - | it is the port we are connected to on the remote machine |

? AT#SS=?

Test command reports the range for **<connId>** parameter.

- Get information about all sockets.

AT#SS

#SS: 1,3,91.80.90.162,61119,88.37.127.146,10510

#SS: 2,4,91.80.90.162,1000

#SS: 3,0

#SS: 4,0

#SS: 5,3,91.80.73.70,61120,88.37.127.146,10509

#SS: 6,0

OK

Socket 1: opened from local IP 91.80.90.162/local port 61119 to remote IP 88.37.127.146/remote port 10510 is suspended with pending data.

Socket 2: listening on local IP 91.80.90.162/local port 1000.

Socket 5: opened from local IP 91.80.73.70/local port 61120 to remote IP 88.37.127.146/remote port 10509 is suspended with pending data.

3.15.22. AT#SI - Socket Info

This command is used to get socket information.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#SI[=<connId>]**

Execution command returns information about all sockets data traffic.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <connId> | integer | NA | socket connection identifier. Refer to Additional info sections to have information about the use of the <connId> parameter |

Value:

1÷conMax : socket connection identifier. conMax value is returned by test command

Additional info:

- ▶▶ If the execution command is used with the <connId> socket identifier, it returns data traffic information on the selected socket. The format of the returned message is:
#SI: <connId>,<sent>,<received>,<buff_in>,<ack_waiting>

| Name | Type | Default | Description |
|--------|---------|---------|---|
| <sent> | integer | - | total amount (in bytes) of data sent since the last time the socket connection identified by <connId> has been opened |

| | | | |
|----------------------------|---------|---|--|
| <received> | integer | - | total amount (in bytes) of received data since the last time the socket connection identified by <connId> has been opened |
| <buff_in> | integer | - | total amount (in bytes) of data just arrived through the socket connection identified by <connId> and currently buffered, not yet read |
| <ack_waiting> | integer | - | total amount (in bytes) of sent and "not yet acknowledged data" since the last time the socket connection identified by <connId> has been opened. The data "not yet acknowledged" are available only for TCP connections. For UDP connections <ack_waiting> value is always 0. |

- ▶▶ If the **AT#SI** command is used without the **<connId>** socket identifier, it returns data traffic information on all sockets. For each socket, the format of the returned message is:

#SI: <connId_{nnnnn}

AT#SI=?

Test command reports the range of **<connId>** parameter.

- Get information about data traffic of all sockets.

```
AT#SI
```

```
#SI: 1,123,400,10,50
```

```
#SI: 2,0,100,0,0
```

```
#SI: 3,589,100,10,100
```

```
#SI: 4,0,0,0,0
```

```
#SI: 5,0,0,0,0
```

```
...
```

```
OK
```

- Assume that sockets 1,2,3 are opened and having some data traffic. To get traffic information only for the socket `<connId>=1` enter the following command:

```
AT#SI=1
```

```
#SI: 1,123,400,10,50
```

```
OK
```

Socket `<connId>=1` has 123 bytes sent, 400 bytes received, 10 bytes waiting to be read and 50 bytes waiting to be acknowledged from the remote side.

3.15.23. AT#ST - Socket Type

Socket Type

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#ST[=<connId>]**

Set command reports the current type of the socket (TCP/UDP) and its direction (Dialer/Listener)

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|------------------------------|
| <connId> | integer | N/A | socket connection identifier |

Value:

1÷conMAX : socket connection identifier. conMax value is returned by test command

Additional info:

- ▶▶ The response format is:

#ST: <connId>,<type>,<direction>

| Name | Type | Default | Description |
|--------|---------|---------|-------------|
| <type> | integer | N/A | socket type |

Values:

0 : No socket

1 : TCP socket

2 : UDP socket

| | | | |
|-------------|---------|-----|-------------------------|
| <direction> | integer | N/A | direction of the socket |
|-------------|---------|-----|-------------------------|

Values:

0 : None

1 : Dialer

2 : Listener

- ▶▶ Issuing **#ST** command without <connId> socket identifier, it returns information about type of all sockets. For each socket, the format of the returned message is:

#ST: <connId_n>,<type_n>,<direction_n><CR><LF>

AT#ST=?

Test command reports the range for parameter <connId>.

Examples for single socket and for all sockets

- For single socket

```
AT#ST=3  
#ST: 3,2,1
```

Socket 3 is an UDP dialer

- for all socket

```
AT#ST  
#ST: 1,0,0  
#ST: 2,0,0  
#ST: 3,2,1  
#ST: 4,2,2  
#ST: 5,1,1
```

...

Socket 1 is closed.

Socket 2 is closed.

Socket 3 is an UDP dialer

Socket 4 is an UDP listener

Socket 5 is a TCP dialer

3.15.24. AT#PADCMD - PAD Command Features

This command sets features of the pending data flush to socket, opened with **#SD** command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#PADCMD=<mode>

Set command for features of the pending data flush to socket, opened with **#SD** command.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------------|
| <mode> | integer | N/A | enable/disable forwarding |

Values:

- 0 : Bit 1: disable forwarding
- 1 : Bit 1: enable forwarding

-  Forwarding depends on character defined by **#PADFWD**.
-  Other bits are reserved.

AT#PADCMD?

Read command reports the currently selected **<mode>** in the format:
#PADCMD: mode

AT#PADCMD=?

Test command reports the supported range of values for parameter **<mode>**.

3.15.25. AT#PADFWD - PAD Forward Character

PAD forward character

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#PADFWD=<char>[,<mode>]

Set command sets the char that immediately flushes pending data to socket opened by AT#SD command

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|---|
| <char> | integer | 13 | specifies the ascii code of the char used to flush data |
| Value: | | | |
| 0÷255 : ascii code of the char used to flush data | | | |
| <mode> | integer | 0 | flush mode |
| Values: | | | |
| 0 : normal mode | | | |
| 1 : reserved | | | |

 Use AT#PADCMD to enable the socket char-flush activity

AT#PADFWD?

Read command reports the currently selected <char> and <mode> in the format:

#PADFWD: <char>,<mode>

 **AT#PADFWD=?**

Test command reports the supported range of values for parameters <char> and <mode>

3.15.26. AT#BASE64 - Base64 Encoding/Decoding of Socket Sent/Received Data

This command is used to enable or disable base64 encoding and decoding data of a socket.

RFC 2045 - MIME
RFC 3548

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#BASE64=<connId>,<enc>,<dec>[,<unused_B>[,<unused_C>]]

Set command enables base64 encoding and decoding of data sent/received to/from the socket in online or in command mode.

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|--|---|
| <connId> | integer | N/A | socket connection identifier |
| Value: | | | |
| 1÷max | : | socket connection identifier value (max value is returned by the Test command) | |
| <enc> | integer | 0 | selects the encoding standard. The data received from serial port are base64 encoded according to the <enc> parameter and forwarded to the <connId> socket. |

Values:

0 : no encoding of data received from serial port.

1 : base64 encoding compliant to RFC 2045 - MIME standard. As indicated from RFC2045 the encoded output stream is represented in lines of no more

than 76 characters each. Lines are defined as sequences of octets separated by a CRLF sequence.

- 2 : base64 encoding compliant to RFC 3548 standard. As indicated from RFC3548 CRLF have not to be added.

| | | | |
|--------------------|---------|---|---|
| <dec> | integer | 0 | selects the decoding standard. The data received from the <connId> socket, are decoded according to the <dec> parameter and forwarded to the serial port. |
|--------------------|---------|---|---|

Values:

- 0 : no decoding of data received from socket **<connId>**
- 1 : base64 decoding compliant to RFC 2045 - MIME standard. Decoding of data received from socket **<connId>** and sent to serial port. Same rule as for **<enc>** regarding line feeds in the received file that has to be decoded.
- 2 : base64 decoding compliant to RFC 3548 standard. Decoding of data received from socket **<connId>** and sent to serial port. Same rule as for **<enc>** regarding line feeds in the received file that has to be decoded.

| | | | |
|-------------------------|---------|---|-------------------------|
| <unused_B> | integer | - | reserved for future use |
| <unused_C> | integer | - | reserved for future use |

- i** It is possible to use command to change current **<enc>/<dec>** settings for a socket already opened in command mode or in online mode after suspending it. In this last case it is necessary to set **AT#SKIPESC=1**.
- i** To use **#BASE64** in command mode, if data to send exceed maximum value for **#SENDEXT** command, they must be divided in multiple parts. These parts must be a multiple of 57 bytes, except

for the last one, to distinguish EOF condition (Base64 encoding rules). For the same reason if **#SRECV** command is used by the application to receive data, a multiple of 78 bytes must be considered.

- i** To use **#SRECV** to receive data with **<dec>** enabled, it is necessary to consider that: reading **<maxByte>** bytes from socket, user will get less due to decoding that is performed.

AT#BASE64?

Read command returns the current **<enc>/<dec>** settings for all the six sockets. The format is:

```
#BASE64:<connId1><enc1>,<dec1>,0,0<CR><LF>
```

...

```
#BASE64:<connId6>,<enc6>,<dec6>,0,0<CR><LF>
```

AT#BASE64=?

Test command returns the range of supported values of all parameters.

- Skip the escape sequence, its transmission is not enabled

```
AT#SKIPESC=1
```

```
OK
```

Open a remote connection in online mode

```
AT#SD=<connId>,<txProt>,<rPort>,<IPAddr>
```

```
CONNECT
```

data sent without modifications (default)

```
.....
```

```
+++ (suspension)
```

```
OK
```

Encode data coming from serial port.

```
AT#BASE64=<connId>,1,0
```

```
OK
```

Resume suspended socket

```
AT#SO=<connId>
```

```
CONNECT
```

data received from serial port are base64 encoded and sent to the socket

```
.....
```

```
+++ (suspension)
```

```
OK
```

Decode data coming from socket.

```
AT#BASE64=<connId>,0,1
```

```
OK
```

Resume suspended socket

```
AT#SO=<connId>
```

```
CONNECT
```

data received from socket are base64 decoded and sent to the serial port

```
.....
```

```
+++ (suspension)
```

```
OK
```

3.15.27. AT#FRWL - Firewall Setup

This command controls the internal firewall settings.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#FRWL=[<action>[,<ip_addr>[,<net_mask>]]]**

Set command controls the internal firewall settings

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <action> | integer | 0 | command action |
| Values: | | | |
| | | 0 | : remove selected chain |
| | | 1 | : add an ACCEPT chain |
| | | 2 | : remove all chains (DROP everything); <ip_addr> and <net_mask> have no meaning in this case. |
| <ip_addr> | string | - | remote address to be added into the ACCEPT chain; it can be any valid IP address in the format: xxx.xxx.xxx.xxx |
| <net_mask> | string | - | mask to be applied on the <ip_addr>; it can be any valid IP address mask in the format: xxx.xxx.xxx.xxx |

Additional info:

►► Firewall criterion

The firewall applies for incoming (listening) connections only. Its general policy is DROP, therefore all packets that are not included into an ACCEPT chain rule will be silently discarded.

When a packet comes from the IP address incoming_IP, the firewall chain rules will be scanned for matching with the following criteria:

incoming_IP & <net_mask> = <ip_addr> & <net_mask>

If criterion is matched, then the packet is accepted and the rule scan is finished; if criteria are not matched for any chain the packet is silently dropped

AT#FRWL?

Read command reports the list of all ACCEPT chain rules registered in the Firewall settings in the format:

```
#FRWL: <ip_addr>,<net_mask>
#FRWL: <ip_addr>,<net_mask>
...
OK
```

AT#FRWL=?

Test command returns the allowed values for parameter <action>.

- Let assume we want to accept connections only from our devices which are on the IP addresses ranging from

197.158.1.1 to 197.158.255.255

We need to add the following chain to the firewall:

```
AT#FRWL=1,"197.158.1.1","255.255.0.0"
OK
```

3.15.28. AT#E2SLRI - Socket Listen Ring Indicator

This command enables the Ring Indicator pin response to a Socket Listen connect.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Required | Common profile | No | - | 2 |

AT#E2SLRI=[<n>]

Set command enables/disables the Ring Indicator pin response to a Socket Listen connect and, if enabled, the duration of the negative going pulse generated on receipt of connect.

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|-------------|
| <n> | integer | 0 | RI enabling |

Values:

- 0 : RI disabled for Socket Listen connect
- 50÷1150 : RI enabled for Socket Listen connect; a negative going pulse is generated on receipt of connect and <n> is the duration in ms of this pulse

AT#E2SLRI?

Read command reports whether the Ring Indicator pin response to a Socket Listen connect is currently enabled or not, in the format:

#E2SLRI: <n>

AT#E2SLRI=?

Test command returns the allowed values for parameter <n>.

3.15.29. AT#ICMP - Ping Support

Set command enables/disables the ICMP Ping support.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#ICMP=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|----------------------|
| <mode> | integer | 1 | ICMP mode selection. |

Values:

- 0 : disable ICMP Ping support
- 1 : enable firewalled ICMP Ping support: the module is sending a proper ECHO_REPLY only to a subset of IP Addresses pinging it; this subset of IP Addresses has been previously specified through #FRWL command.
- 2 : enable free ICMP Ping support; the module is sending ECHO_REPLY to every IP Address pinging it.

AT#ICMP?

Read command returns whether the ICMP Ping support is currently enabled or not, in the format:

#ICMP: <mode>

AT#ICMP=?

Test command reports the supported range of values for the **<mode>** parameter.

3.15.30. AT#PING - Send PING Request

This command is used to send Ping Echo Request.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

 **AT#PING=<IPaddr>[,<retryNum>[,<len>[,<timeout>[,<ttl>[,<pdpld>]]]]]**

Execution command is used to send Ping Echo Request messages and to receive the corresponding Echo Reply. Before sending PING Request the PDP context must be activated by **#SGACT** command.

Once the single Echo Reply message is received, a string like that is displayed:

#PING: <replyld>,<Ip Address>,<replyTime>,<ttl>

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <IPaddr> | string | - | address of the remote host, string type. This parameter can be either: - any valid IP address in the format: "xxx.xxx.xxx.xxx" - any host name to be solved with a DNS query |
| <retryNum> | integer | 4 | the number of Ping Echo Request to send |
| | Value: | 1÷64 | : Ping Echo Request number |
| <len> | integer | 32 | the length of Ping Echo Request message |
| | Value: | | |

32÷1460 : Ping Echo Request length

<timeout> integer 50 the timeout, in 100 ms units, waiting a single Echo Reply

Value:

1÷600 : timeout, in 100 ms units

<tll> integer 128 time to live

Value:

1÷255 : time to live

<pdpld> integer - specifies a PDP context definition. Use the **AT+CGDCONT=?** test command to get the range of the supported values. Refer to additional info section for default value.

Additional info:

►► **<pdpld>** default value.

The default value of this parameter depends on the software customization as shown in the following table.

| Software customization | <pdpld> default value |
|------------------------|-----------------------|
| Verizon | 3 |
| All other | 1 |

Unsolicited fields:

| Name | Type | Description |
|--------------------------|---------|---|
| <replyld> | integer | Echo Reply number |
| <lpAddress> | string | IP address of the remote host |
| <replyTime> | integer | time, in 100 ms units, required to receive the response |

| | | |
|-------|---------|--|
| <tll> | integer | time to live of the Echo Reply message |
|-------|---------|--|

- i** When the Echo Request timeout expires (no reply received on time) the response will contain <replyTime> set to 600 and <tll> set to 255.
- i** To receive the corresponding Echo Reply is not required to enable separately **#ICMP**

? AT#PING=?

Test command reports the supported range of values for the **#PING** command parameters.

```
</> AT#PING="www.telit.com"  
#PING: 01,"81.201.117.177",6,50  
#PING: 02,"81.201.117.177",5,50  
#PING: 03,"81.201.117.177",6,50  
#PING: 04,"81.201.117.177",5,50  
OK
```

3.15.31. AT#QDNS - Query DNS

The command executes a DNS query

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#QDNS[=<host name>]

Execution command executes a DNS query to solve the host name into an IP address. If the DNS query is successful, then the IP address will be reported in the result code as follows:

#QDNS: <host name>,<IP address>

Parameter:

| Name | Type | Default | Description |
|-------------|--------|---------|------------------|
| <host name> | string | - | Host name string |

Additional info:

- ▶▶ IP address in the result code

| Name | Type | Default | Description |
|--------------|--------|---------|--|
| <IP address> | string | - | IP address in format "xxx.xxx.xxx.xxx", or empty string if DNS query was unsuccessful. |

- i** The command activates the PDP context if it was not previously activated. In this case the context is deactivated after the DNS query.
- i** This command requires that the authentication parameters are correctly set, and the PS network is present.

 **AT#QDNS=?**

Test command returns the **OK** result code.

3.15.32. AT#NWDNS - DNS from Network

The command allows to get the primary and secondary DNS addresses for selected GSM or PDP context identifiers

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#NWDNS=[<cid>[,...]]

Execution command returns either the primary and secondary DNS addresses for the GSM context (if specified) and/or a list of primary and secondary DNS addresses for the specified PDP context identifiers. The command returns a row of information for every specified <cid> whose context has been already defined. No row is returned for a <cid> whose context has not been defined yet. The response is in the form:

```
#NWDNS: <cidn>,<PDNSaddressn>,<SDNSaddressn><CR><LF>
```

```
#NWDNS: <cidp>,<PDNSaddressp>,<SDNSaddressp><CR><LF>
```

```
...
```

```
#NWDNS: <cidq>,<PDNSaddressq>,<SDNSaddressq><CR><LF>
```

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|--|
| <cid> | integer | N/A | Generic context identifier. The value of max is returned by the test command |

Value:

1÷max : specifies a particular PDP context definition (see +CGDCONT command)

Additional info:

- ▶ Parameters response description:

| Name | Type | Default | Description |
|---------------|--------|---------|---|
| <PDNSAddress> | string | - | Generic primary DNS address or assigned during PDP (or GSM) context activation. |
| <SDNSAddress> | string | - | Generic secondary DNS address or assigned during PDP (or GSM) context activation. |

- i** Entering **AT#NWDNS=** (no <cid> specified), the DNS addresses for all defined contexts are returned.
- i** Issuing the command with more than 6 input parameters raises an error.
- i** The command returns only one row of information for every specified <cid>, even if the same <cid> is present more than once.

AT#NWDNS=?

Test command returns a list of defined <cid>s.

3.15.33. AT#NTP - Calculate and Update Date and Time with NTP

The command handles the date and time update using NTP protocol.

[1] Standard RFC2030

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | 10 s | 2 |

AT#NTP=<NTPAddr>,<NTPPort>,<updModClock>,<timeout>[,<timeZone>]

Execution command permits to calculate and update date and time through NTP protocol sending a request to a NTP server, see standard [1]. The command returns an intermediate response having the following format:

#NTP: <time>

The <time> parameter is described in Additional info section.

Parameters:

| Name | Type | Default | Description |
|-----------|---------|---------|---|
| <NTPAddr> | string | - | address of the NTP server. This parameter can be either: 57. any valid IP address in the format: "xxx.xxx.xxx.xxx" or "xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xx xx" 58. any host name to be solved with a DNS query |
| <NTPPort> | integer | N/A | NTP server port to contact |

Value:

1÷65535 : port

| | | | |
|----------------------------|---------|-----|-------------|
| <updModClock> | integer | N/A | update mode |
| > | r | | |

Values:

0 : no update module clock

1 : update module clock

| | | | |
|------------------------|---------|-----|---|
| <timeout> | integer | N/A | waiting timeout for server response in seconds. Due to internal algorithm the total timeout will be up to 3* <timeout> . |
| | r | | |

Value:

1÷10 : waiting timeout for server response in seconds

| | | | |
|-------------------------|--------|---|---|
| <timeZone> | string | 0 | Time Zone: indicates the difference, expressed in quarter of an hour, between the local time and GMT. |
|-------------------------|--------|---|---|

Value:

-47÷48 : Time Zone

Additional info:

- ▶▶ Intermediate response parameter.

| Name | Type | Default | Description |
|---------------------|--------|---------|---|
| <time> | string | - | current time as quoted string in the format: "yy/MM/dd,hh:mm:ss±zz" |

- ▶▶ In case of error, the command returns the following error message:
+CME ERROR: <err>
Parameter **<err>** can be either numeric or verbose (see **+CMEE**). The available values are reported in the table:

| Numeric Format | Verbose Format |
|----------------|-----------------------------------|
| 30001 | sntp - not enough resources |
| 30002 | sntp - net timeout |
| 30003 | sntp - socket error |
| 30005 | sntp - host name resolve error |
| 30006 | sntp - invalid parameter |
| 30008 | sntp - send timeout |
| 30009 | sntp - send error |
| 30011 | sntp - response timeout |
| 30015 | sntp - context not opened |
| 30020 | sntp - generic error |
| 30030 | sntp - server authentication fail |
| 30031 | sntp - server keys file missing |
| 30200 | sntp - cannot set time |

- i** The Time Zone is applied directly in the Date and Time received by the NTP Server, that is, by definition, GMT+0.
- i** **#SGACT** must be called to activate the PDP context before calling **#NTP** command.

? AT#NTP=?

Test command returns the maximum length for **<NTPAddr>** string, and supported range of values of parameters: **<NTPPort>**, **<updModClock>**, **<timeout>** and **<timeZone>**.

Execution command with NTP server.

```
AT#NTP="0.it.pool.ntp.org",123,1,2,4  
#NTP: 19/03/13, 13:16:33+04  
OK
```

```
AT+CCLK?  
+CCLK: "19/03/13, 13:16:34+04"  
OK
```

3.15.34. AT#NTPCFG - Configure NTP Parameters

This set command allows to configure additional parameters to be used for NTP operations.

[1] Standard RFC5905

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#NTPCFG=<cid>[,<authType>,<Keyld>,<keysFilePath>]

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <cid> | integer | - | context id used to perform NTP operations. Refer to test command to know the supported range of values. |
| <authType> | integer | 0 | authentication type to be used with NTP server |

Values:

0 : do not authenticate server

1 : use symmetric key to authenticate server (see standard [1]), using <Keyld> and <KeysFilePath> to retrieve the required parameters

| | | | |
|----------------|---------|---|---|
| <Keyld> | integer | - | if <authType> is 1, it provides the key Id to authenticate the server |
| <keysFilePath> | string | - | if <authType> is 1, it provides the absolute path of the file where the |

server keys can be found. Only MD5 keys are supported.

- i** The file containing the keys can be loaded in the module filesystem using **#M2MWRITE** command.
- i** The key content is loaded from the file only when **#NTP** is issued.

AT#NTPCFG?

Read command reports the parameters current values in the format:

```
#NTPCFG:<cid>,<authType >
```

AT#NTPCFG=?

Test command reports the available range of <cid>, <authType> and <Keyld> parameters values.

```
Set <cid>=3  
AT#NTPCFG=3  
OK
```

Set <cid>=1, symmetric key mode, <keyld>=1 and load the keys from the provided file

```
AT#NTPCFG=1,1,1,"/mod/server_keys.txt"  
OK
```

3.15.35. AT#SCFGEXT3 - Socket Configuration Extended 3

This command sets the socket configuration extended parameters for features not included in **#SCFGEXT** command nor in **#SCFGEXT2** command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SCFGEXT3=<connId>,<immRsp>[,<closureTypeCmdModeEnabling>[,<fastSRING>[,<ssendTimeout>[,<unusedD>]]]]**

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|--|
| <connId> | integer | N/A | socket connection identifier |
| <immRsp> | integer | 0 | enables #SD command mode immediate response |

Value:

1÷max : socket connection identifier value (max value is returned by the test command)

Values:

0 : **#SD** in command mode (see **#SD**) returns after the socket is connected

1 : **#SD** in command mode returns immediately; then the state of the connection

can be read by the AT
command #SS

| | | | |
|------------------------------|---------|---|--|
| <closureTypeCmdModeEnabling> | integer | 0 | it has no effect and is included only for backward compatibility |
|------------------------------|---------|---|--|

Value:

0 : factory default

| | | | |
|-------------|---------|---|--|
| <fastSRING> | integer | 0 | it has no effect and is included only for backward compatibility |
|-------------|---------|---|--|

Value:

0 : factory default

| | | | |
|----------------|---------|---|--------------------|
| <ssendTimeout> | integer | 0 | timeout for #SSEND |
|----------------|---------|---|--------------------|

Values:

0 : no timeout

1 : immediate exit(error) in case of stack temporary suspended internally

100÷600 : timeout in 100 msec units

| | | | |
|-----------|-------|---|------------------|
| <unusedD> | mixed | 0 | unused parameter |
|-----------|-------|---|------------------|

Value:

0 : factory default

 **AT#SCFGEXT3?**

Read command returns the current socket extended configuration parameters values for all the max sockets, in the format:

```
#SCFGEXT3:<connId1>,<immRsp1>,<closureTypeCmdModeEnabling>,  
<fastsring>,<ssendTimeout>,0<CR><LF>
```

...

```
#SCFGEXT3:<connIdmax>,<immRspmax>,<closureTypeCmdModeEnabling>,  
<fastsring>,<ssendTimeout>,0<CR><LF>
```

 **AT#SCFGEXT3=?**

Test command returns the range of supported values for all the parameters.

3.16. FTPEasy

3.16.1. AT#FTPAPP - FTP Append

This command is used to append data to an already existing file via FTP during an FTP session.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#FTPAPP=<fileName>[,<connMode>]

Set command, issued during an FTP connection, opens a data connection and append data to existing <fileName> file.

If the data connection succeeds, a **CONNECT** indication is sent, afterward a **NO CARRIER** indication is sent when the socket is closed.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---------------------|
| <fileName> | string | - | the file name |
| <connMode> | integer | 0 | the connection mode |

Values:

- 0 : online mode
- 1 : command mode

- i** If <connMode> is set to 1, the data connection is opened, the device remains in command mode and the **OK** result code is displayed (instead of **CONNECT**).
- i** Use the escape sequence **+++** to close the data connection.

-  The command causes an **ERROR** result code if no FTP connection has been opened yet.

 **AT#FTPAPP=?**

Test command reports the maximum length of **<fileName>** and the supported range of values of **<connMode>**. The format is:

#FTPAPP: <length>, (list of supported **<connMode>**s)

Additional info:

- ▶▶ Parameter meaning.

| Name | Type | Default | Description |
|-----------------------|---------|---------|--|
| <length> | integer | - | is the maximum length of <fileName> |

3.16.2. AT#FTPAPPEXT - FTP Append Extended

The command sends data on a FTP data port while the module is in command mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPAPPEXT=<bytesToSend>[,<eof>]

Execution command sends data on a FTP data port while the module is in command mode.

FTP data port must be previously opened by #FTPPUT (or #FTPAPP) with <connMode> parameter set to command mode connection.

After command line is terminated with <CR>, the module responds sending a four characters sequence prompt, and waits for the specified number of bytes:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

When <bytesToSend> bytes have been sent, operation is automatically completed. If (all or part of the) data are successfully sent, then the response is:

#FTPAPPEXT: <sentBytes>
OK

If data sending fails for some reason, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|--------------------------|---------|---------|----------------------------|
| <bytesToSend> | integer | N/A | number of bytes to be sent |
| Value: | | | |
| 1÷1500 : number of bytes | | | |

| | | | |
|--------------------|---------|---|-------------------|
| <eof> | integer | 0 | data port closure |
|--------------------|---------|---|-------------------|

Values:

0 : normal sending of data chunk

1 : close data port after sending data chunk

Additional info:

▶▶ Parameters:

| Name | Type | Default | Description |
|--------------------------|---------|---------|--------------------------|
| <sentBytes> | integer | N/A | the number of sent bytes |

Value:

1÷1500 : number of bytes

i **<sentBytes>** could be less than **<bytesToSend>**.

AT#FTPAPPEXT=?

Test command reports the supported values of parameters **<bytesToSend>** and **<eof>**.

```
AT#FTPOPEN="IP",username,password  
OK
```

```
AT#FTPPUT=<filename>,1  
OK
```

the second param (1) means that we open the connection in command mode
Here data socket will stay opened, but interface will be available (command mode)

```
AT#FTPAPPEXT=Size  
>binary data  
#FTPAPPEXT: <sentBytes>  
OK
```

write here the binary data. As soon Size bytes are written, data are sent and
OK is returned

Last **#FTPAPPEXT** will close the data socket, because second (optional)
parameter has this meaning:

```
AT#FTPAPPEXT=Size,1  
>binary data  
#FTPAPPEXT: <sentBytes>  
OK
```

write here the binary data. As soon Size bytes are written, data are sent and
OK is returned and the data socket is closed.

If the user has to reopen the data port to send another (or append to the
same) file, they can restart with **#FTPPUT** (or **#FTPAPP**).

Then **#FTPAPPEXT** to send the data chunks on the reopened data port.

If, while sending the chunks, the data port is closed from remote, user will
be aware of it because **#FTPAPPEXT** will indicate **ERROR** and cause
(available if previously issued the command **AT+CMEE=2**) will indicate that
socket has been closed.

Also in this case obviously, data port will have to be reopened with **#FTPPUT**
and the related commands.

3.16.3. AT#FTPCLOSE - FTP Close Command

The command purpose is to close the previously open FTP connection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPCLOSE

Execution command closes an FTP connection.

AT#FTPCLOSE=?

Test command returns the **OK** result code.

3.16.4. AT#FTPCMD - FTP Send Commands

This command sends an FTP command or a combination of two commands to an FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

AT#FTPCMD=<command1>,<respCode1>[,<command2>,<respCode2>]

Execution command, issued during an FTP connection, sends <command1> to an FTP server and expects <respCode1> reply. Optionally, after the execution of the first command, a second command can be sent (<command2> and <respCode2>).

Parameters:

| Name | Type | Default | Description |
|-----------------------|---------|---------|---|
| <command1> | string | - | name of the 1 st command (maximum length 200 characters) |
| <respCode1> | integer | N/A | Expected response code from FTP server after <command1> execution |
| Values: | | | |
| 1 : Expected code 1XY | | | |
| 2 : Expected code 2XY | | | |
| 3 : Expected code 3XY | | | |
| 4 : Expected code 4XY | | | |
| 5 : Expected code 5XY | | | |
| <command2> | string | - | name of the 2 nd command (maximum length 200 characters) |
| <respCode2> | integer | N/A | Expected response code from FTP server after <command2> execution |
| Values: | | | |

- 1 : Expected code 1XY
- 2 : Expected code 2XY
- 3 : Expected code 3XY
- 4 : Expected code 4XY
- 5 : Expected code 5XY

- i** The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.
- i** To read unexpected **ERROR** result codes returned from the FTP server, use **AT#FTPMSG** command.

AT#FTPCMD=?

Test command reports the maximum length of **<command1>** and **<command2>** and the supported range of values of **<respCode1>** and **<respCode2>**.

Additional info:

- ▶▶ The format is:
#FTPCMD: <length>, (list of supported **<respCode1>**s), **<length>**,
 (list of supported **<respCode2>**s)

| Name | Type | Default | Description |
|-----------------------|---------|---------|--|
| <length> | integer | - | maximum length of <command1> or <command2> |

Examples of command executions.

- Rename file on remote server:
`at#ftpcmd="RNFR test.txt",3,"RNT0 test2.txt",2`
350 File or directory exists, ready for destination name
250 Rename successful
OK
...
...
Create directory on remote server:
`at#ftpcmd="MKD testDir",2`
257 "/testDir" - Directory successfully created
OK
...
...
Remove Directory on remote server:
`at#ftpcmd="RMD testDir",2`
250 RMD command successful
OK
...
...

3.16.5. AT#FTPCWD - FTP Change Working Directory

Command to change the working directory on FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPCWD=[<dirname>]

Execution command, issued during an FTP connection, changes the working directory on FTP server.

Parameter:

| Name | Type | Default | Description |
|-----------|--------|---------|------------------------------------|
| <dirname> | string | - | Name of the new working directory. |

-  The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.

AT#FTPCWD=?

Test command returns the **OK** result code.

3.16.6. AT#FTPDELE - FTP Delete

This command, issued during a FTP connection, allows to delete a file from the remote working directory.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPDELE=[<filename>]

Execution command, issued during a FTP connection, deletes a file from the remote working directory.

Parameter:

| Name | Type | Default | Description |
|------------|--------|---------|---------------------------------------|
| <filename> | string | - | Name of the file that must be deleted |

-  This command returns an **ERROR** result code if no FTP connection has been opened yet.
-  This command returns an **ERROR** result code in case of delayed server response.
If this is the case, the **#FTPMSG** response is temporarily empty; a later check of the **#FTPMSG** response will show the server response.

AT#FTPDELE=?

Test command returns **OK** result code.

3.16.7. AT#FTPFSIZE - Get File Size from FTP Server

This command returns the size of a file located on a FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPFSIZE=<filename>

Execution command, issued during an FTP connection, permits to get the size of a file located on a FTP server. The response format is:

#FTPFSIZE: <size>

Parameter:

| Name | Type | Default | Description |
|------------|--------|---------|---|
| <filename> | string | - | the name of the file that you want to know the size |

Additional info:

▶▶ Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <size> | integer | - | dimension in bytes of the file located on the FTP server |

- i** AT#FTPTYPE=0 command must be issued before #FTPFSIZE command, to set file transfer type to binary mode.

 **AT#FTPFSIZE=?**

Test command returns **OK** result code.

3.16.8. AT#FTPGET - FTP Get Command

This command executes the FTP Get function during an FTP connection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#FTPGET=[<filename>]

Execution command opens a data connection and starts getting a file from the FTP server. If the data connection succeeds a **CONNECT** indication is sent and the file is received on the serial port.

Parameter:

| Name | Type | Default | Description |
|------------|--------|---------|-------------------------------|
| <filename> | string | - | file name to get from server. |

-  The command causes an **ERROR** result code to be returned in case no FTP connection has been opened yet.
-  Command closure should always be handled by application. To avoid download stall situations a timeout should be implemented by the application.

AT#FTPGET=?

Test command returns the **OK** result code.

3.16.9. AT#FTPGETF - Receive and Store FTP Server Data

This command downloads a file from a FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | Yes | - | 2 |

 **AT#FTPGETF=<src_filename>,<dest_filename>[,<verbose>[,<overwrite_file>]]**

Execution command, issued during a FTP connection, opens a data connection and starts downloading a file from the FTP server.

The file is saved into module's file system.

Parameters:

| Name | Type | Default | Description |
|-----------------|---------|---------|--|
| <src_filename> | string | - | name of the file to be downloaded |
| <dest_filename> | string | - | name of the destination file to be written into the module file system |
| <verbose> | integer | 0 | enable/disable verbose mode |

Values:

0 : disable verbose mode

1 : enable verbose mode

| | | | |
|------------------|---------|---|--------------------------------------|
| <overwrite_file> | integer | 0 | file overwriting allowed/not allowed |
|------------------|---------|---|--------------------------------------|

Values:

0 : overwrite NOT allowed (if file exists, the AT command returns ERROR)

1 : overwrite allowed (if file exists, it will be overwritten)

- i** This command returns an **ERROR** result code if no FTP connection has been opened yet.
- i** Command closure should always be handled by application. A timeout should be implemented by the application to avoid download stall situations.
- i** When verbose mode is enabled, i.e. **<verbose>** is set to 1, the '#' character is printed on the AT command port for every 4096 bytes that were written in FS

? AT#FTPGETF=?

Test command returns the maximum length of **<src_filename>** and **<dest_filename>** and the supported range of parameters **<verbose>** and **<overwrite_file>**.

3.16.10. AT#FTPGETPKT - FTP Get in Command Mode

FTP gets in command mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPGETPKT=<fileName>[,<viewMode>]

Execution command, issued during an FTP connection, opens a data connection and starts getting a file from the FTP server while remaining in command mode.

The data port is opened, we remain in command mode and we see the result code **OK**.

Retrieval from FTP server of <fileName> is started, but data are only buffered in the module.

It is possible to read data afterwards issuing **#FTPRECV** command.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|--|
| <fileName> | string | - | file name. Maximum length: 200 characters. |
| <viewMode> | integer | 0 | choose the view mode |

Values:

0 : text format

1 : hexadecimal format

-  The command causes an **ERROR** result code to be returned in case no FTP connection has been opened yet.
-  Command closure should always be handled by application. To avoid download stall situations a timeout should be implemented by the application.

**AT#FTPGETPKT?**

Read command reports current download state for <fileName> with <viewMode> chosen, in the format:

#FTPGETPKT: <remoteFile>,<viewMode>,<eof>

Additional info:

- ▶▶ The following parameter signals the state of the file transmission.

| Name | Type | Default | Description |
|-------|---------|---------|-------------|
| <eof> | integer | N/A | End of file |

Values:

- 0 : file currently being transferred
- 1 : complete file has been transferred to FTP client

**AT#FTPGETPKT=?**

Test command returns **OK** result code.

3.16.11. AT#FTPLIST - FTP List

This command is used during a FTP connection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#FTPLIST=[<name>]

Execution command, issued during an FTP connection, opens a data connection and starts getting from the server the list of contents of the specified directory or the properties of the specified file

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|--------------------------------------|
| <name> | string | - | is the name of the directory or file |

-  The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.
-  Issuing **AT#FTPLIST<CR>** opens a data connection and starts getting from the server the list of contents of the working directory.

AT#FTPLIST=?

Test command returns the **OK** result code.

3.16.12. AT#FTPMSG - FTP Read Message

This command returns the last response received from the FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPMSG

Execution command returns the last response received from the server during an FTP connection.

AT#FTPMSG=?

Test command returns the **OK** result code.

3.16.13. AT#FTPOPEN - FTP Connection Opening

This execution command opens an FTP connection toward the FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#FTPOPEN=[<server:port>,<username>,<password>,<mode>[,<cid>]]**

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <server:port> | string | - | address and port of FTP server (factory default port 21), in the format: 59. "ipv4" / "ipv4:port" 60. "ipv6" / "[ipv6]" / "[ipv6]:port" 61. "dynamic_name" / "dynamic_name:port" |
| <username> | string | - | authentication user identification for FTP |
| <password> | string | - | authentication password for FTP |
| <mode> | integer | 0 | active or passive mode |
| Values: | | | |
| 0 : active mode | | | |
| 1 : passive mode | | | |
| <cid> | string | - | PDP context identifier |

-  In FTP Open case, the solution dependency limits the maximum time out to 1200 (120 seconds). The FTPTO value that exceed 1200 is considered as 1200.
-  Before opening FTP connection the PDP context must been activated with **#SGACT**.

AT#FTPOPEN=?

Test command returns the **OK** result code

3.16.14. AT#FTPPUT - FTP Send File

This command sends a file to the FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

 **AT#FTPPUT=[<filename>[,<connMode>]]**

Execution command, issued during an FTP connection, opens a data connection and starts sending <filename> file to the FTP server.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <filename> | string | - | name of the file (maximum length 200 characters) |
| <connMode> | integer | 0 | <p>select online or command mode: If online mode is selected (default) and the data connection succeeds, a CONNECT indication is sent; afterward a NO CARRIER indication is sent when the socket is closed.</p> <p>If command mode is selected and the data connection succeeds, we remain in command mode and we see the result code OK (instead of CONNECT).</p> |

Values:

- 0 : online mode
- 1 : command mode

 Use the escape sequence **+++** to close the data connection.

- i** The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.

?  AT#FTPPUT=?

Test command reports the maximum length of <filename> and the supported range of values of <connMode>.

Additional info:

- ▶▶ The format is:
#FTPPUT: <length>, (list of supported <connMode>s)

| Name | Type | Default | Description |
|----------|---------|---------|------------------------------|
| <length> | integer | - | maximum length of <filename> |

3.16.15. AT#FTPPWD - FTP Print Working Directory

This command, issued during an FTP connection, shows the current working directory on FTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPPWD

Execution command, issued during an FTP connection, shows the current working directory on FTP server.

-  The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.

AT#FTPPWD=?

Test command returns the **OK** result code.

3.16.16. AT#FTPRECV - Receive Data in Command Mode

The command permits the user to read a given amount of data already transferred via FTP from a remote file.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#FTPRECV=<blockSize>

Execution command permits the user to transfer at most <blocksize> bytes of remote file, provided that retrieving from the FTP server has been started with a previous #FTPGETPKT command, onto the serial port.

This number is limited to the current number of bytes of the remote file which have been transferred from the FTP server.

Parameter:

| Name | Type | Default | Description |
|-------------|---------|---------|---------------------------------|
| <blockSize> | integer | N/A | maximum number of bytes to read |

Value:

1÷3000 : maximum number of bytes to read

- i** It is necessary to have previously opened FTP data port and started download and buffering of remote file through #FTPGETPKT command.
- i** Issuing #FTPRECV when there is no FTP data port opened raises an error.
- i** Data port will stay opened if socket is temporary waiting to receive data (#FTPRECV returns 0 and #FTPGETPTK gives an EOF 0 indication).

AT#FTPRECV?

Read command reports the number of bytes currently transferred from FTP server in the format:

#FTPRECV: <available>

Additional info:

▶▶ Parameter:

| Name | Type | Default | Description |
|-------------|---------|---------|---|
| <available> | integer | - | number of transferred bytes and available for reading |

AT#FTPRECV=?

Test command returns the supported values for parameter **<blocksize>**.

```
AT#FTPRECV?  
#FTPRECV: 3000  
OK
```

Read required part of the buffered data:

```
AT#FTPRECV=400  
#FTPRECV:400  
Text row number 1 * 11111111111111111111111111111111 *  
Text row number 2 * 222222222222222222222222222222 *  
Text row number 3 * 333333333333333333333333333333 *  
Text row number 4 * 444444444444444444444444444444 *  
Text row number 5 * 555555555555555555555555555555 *  
Text row number 6 * 666666666666666666666666666666 *  
Text row number 7 * 777777777777777777777777777777 *  
Text row number 8 * 888888888888888888888888888888  
OK
```

```
AT#FTPRECV=200  
#FTPRECV:200  
88888 *  
Text row number 9 * 999999999999999999999999999999 *  
Text row number 10 * AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA *  
Text row number 11 *BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB *  
Text row number 12 * CCCCCCCCCCCCCCCCCC  
OK
```

To check when you have received complete file it is possible to use
#FTPGETPKT read command:

```
AT#FTPGETPKT?  
#FTPGETPKT:sample.txt,0,1  
OK
```

[you will get <eof> set to 1]

3.16.17. AT#FTPREST - Set Restart Position for FTP GET

Set command sets the restart position for successive **#FTPGET** (or **#FTPGETPKT**) command. It permits to restart a previously interrupted FTP download from the selected position in byte.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#FTPREST=[<restartPosition>]

Parameter:

| Name | Type | Default | Description |
|-------------------|---------|---------|--|
| <restartPosition> | integer | - | position in byte of restarting for successive #FTPGET (or #FTPGETPKT) |

- i** It is necessary to issue **#FTPTYPE=0** before successive **#FTPGET** (or **#FTPGETPKT** command) to set binary file transfer type.
- i** Setting <restartPosition> takes effect on successive FTP download. After successive successfully initiated **#FTPGET** (or **#FTPGETPKT**) command <restartPosition> is automatically reset.
- i** Value set for <restartPosition> takes effect on next data transfer (data port opened by **#FTPGET** or **#FTPGETPKT**). Then <restartPosition> value is automatically assigned to 0 for next download.

AT#FTPREST?

Read command returns the current <restartPosition>:

#FTPREST:<restartPosition>

 **AT#FTPREST=?**

Test command returns the **OK** result code.

3.16.18. AT#FTPT0 - FTP Time Out

Set the FTP time out.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#FTPT0=[<tout>]

Set command sets the time out used when opening either the FTP control channel or the FTP traffic channel.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|------------------------------------|
| <tout> | integer | 100 | time out in 100 milliseconds units |

Value:

100÷5000 : hundreds of milliseconds

AT#FTPT0?

Read command returns the current FTP operations time out in the format:
#FTPT0: <tout>

AT#FTPT0=?

Test command returns the supported values of parameter <tout>.

3.16.19. AT#FTPTYPE - FTP Type

This command sets the FTP file transfer type.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#FTPTYPE=[<type>]

Set command, issued during a FTP connection, sets the file transfer type.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------|
| <type> | integer | N/A | file transfer type |

Values:

0 : binary

1 : ASCII

-  The command causes an **ERROR** result code to be returned if no FTP connection has been opened yet.

AT#FTPTYPE?

Read command returns the current file transfer type, in the format:

#FTPTYPE: <type>

AT#FTPTYPE=?

Test command returns the range of available values for parameter <type>:

#FTPTYPE: (0,1)

3.16.20. AT#FTPCFG - FTP Configuration

This command sets the time-out used when opening either the FTP control channel or the FTP traffic channel.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#FTPCFG=<tout>,<IPPignoring>[,<FTPSEn>,<FTPext>]]**

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|--------|---------|-----|------------------------------------|
| <tout> | integer | 100 | time out in 100 milliseconds units |
|--------|---------|-----|------------------------------------|

Value:

100÷5000 : hundreds of ms

| | | | |
|---------------|---------|-----|---------------------------------------|
| <IPPignoring> | integer | N/A | enable or disable IP private ignoring |
|---------------|---------|-----|---------------------------------------|

Values:

0 : No IP Private ignoring. During a FTP passive mode connection client uses the IP address received from server, even if it is a private IPV4 address.

1 : IP Private ignoring enabled. During a FTP passive mode connection if the server sends a private IPV4 address the client doesn't consider this and connects with server using the IP address used in #FTPOPEN.

| | | | |
|----------|---------|---|-----------------------|
| <FTPSEn> | integer | 0 | disable FTPS security |
|----------|---------|---|-----------------------|

Values:

0 : disable FTPS security: all FTP commands will perform plain FTP connections.

1 : enable FTPS security

| | | | |
|-----------------------|---------|---|--|
| <FTPext> | integer | 1 | PORT/PASV and EPRT/EPST commands. Option added to pass-through firewall that is unaware of the extended FTP commands for #FTPPUT , #FTPLIST , #FTPAPP , #FTPGET . |
|-----------------------|---------|---|--|

Values:

0 : always use EPRT and EPSV commands

1 : if both module and server ipv4 use PORT and PASV commands

- i** If parameter **<tout>** is omitted the behavior of set command is the same as read command.
-

AT#FTPCFG?

Read command reports the currently selected parameters in the format:

#FTPCFG: <tout>,<IPPIgnoring>,<FTPSEn>,<FTPext>

AT#FTPCFG=?

Test command reports the supported range of values for parameter(s): **<tout>**, **<IPPIgnoring>**, **<FTPSEn>**, and **<FTPext>**.

3.17. SMTP

3.17.1. AT#ESMTP - E-mail SMTP Server

This command allows to set the SMTP server address for e-mail sending.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ESMTP=<smtp>

Set command sets the SMTP server address, used for sending e-mails. SMTP server can be specified as IP address or as nick name.

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|--|
| <smtp> | string | - | SMTP server address. This parameter can be either: <ol style="list-style-type: none"> 62. any valid IP address in the format: "xxx.xxx.xxx.xxx" 63. any host name to be solved with a DNS query in the format: <host name> (factory default is the empty string ""). |

- i** The SMTP server used shall be inside the APN space (the SMTP server provided by the network operator) or it must allow the relay, otherwise the command will refuse to send the e-mail.

AT#ESMTP?

Read Command reports the current SMTP server address, in the format:

#ESMTP: <smtp>

 **AT#ESMTP=?**

Test command returns the max length for the parameter <smtp>.

</> Example of SMTP server format name:
AT#ESMTP="smtp.mydomain.com"
OK

3.17.2. AT#EMAILMSG - SMTP Read Message

The command returns the last response from SMTP server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT#EMAILMSG

Execution command returns the last response from SMTP server.

AT#EMAILMSG=?

Test command returns the **OK** result code.

3.17.3. AT#SMTPCFG - Configure SMTP Parameters

Configure SMTP parameters

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#SMTPCFG=<ssl_enabled>[,<port>[,<mode>[,<unused1>[,<unused2>[,<cid>]]]]]**

Sets the parameters needed to the SMTP connection

Parameters:

| Name | Type | Default | Description |
|-------------------------------------|---------|---------|---|
| <ssl_enabled> | integer | 0 | Numeric parameter indicating if the SSL encryption is enabled |
| Value: | | | |
| 0 : SSL encryption disabled | | | |
| <port> | string | 25 | SMTP port to contact |
| Value: | | | |
| 1÷65535 : SMTP ports to contact | | | |
| <mode> | integer | 0 | SMTP start session command |
| Values: | | | |
| 0 : SMTP start session command HELO | | | |
| 1 : SMTP start session command EHLO | | | |
| <unused1> | integer | 0 | for future purposes |
| Value: | | | |
| 0 : use this value | | | |
| <unused2> | integer | 0 | for future purposes |

Value:

0 : use this value

| | | | |
|--------------------|---------|-----|---|
| <cid> | integer | N/A | PDP context identifier. Refer to additional info section for default value. |
|--------------------|---------|-----|---|

Value:

1÷6 : available value

Additional info:

►► **<cid>** default value.

The default value of this parameter depends on the software customization as shown in the following table.

| Software customization | <cid> default value |
|------------------------|---------------------|
| Verizon | 3 |
| All other | 1 |

AT#SMTPCFG?

Returns the current settings in the format:

#SMTPCFG:<ssl_enabled>,<port>,<mode>,0,0,<cid><CR><LF>

AT#SMTPCFG=?

Returns the supported range of parameters **<ssl_enabled>**, **<port>**, **<mode>** in the format:

#SMTPCFG:(list of supported <ssl_enabled>s),(list of supported <port>s), (list of supported <mode>s), (0), (0), (0)

3.17.4. AT#ERST - E-mail Parameters Reset

This execution command resets the e-mail parameters to the "factory default" configuration.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ERST

The e-mail parameters to reset are:

- 64. E-mail User Name
- 65. E-mail Password
- 66. E-mail Sender Address
- 67. E-mail SMTP server

AT#ERST=?

Test command returns the **OK** result code.

3.17.5. AT#ESAV - E-mail Parameters Save

This execution command stores the e-mail parameters in the NVM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ESAV

The e-mail parameters that are stored are:

- 68. E-mail User Name
- 69. E-mail Password
- 70. E-mail Sender Address
- 71. E-mail SMTP server

AT#ESAV=?

Test command returns the **OK** result code.

-  If a parameter value has not been previously specified using the e-mail parameters setting commands, like **#EADDR**, then a default value will be taken.

3.17.6. AT#EUSER - E-mail Authentication User Name

This command sets the user identification string to be used during the SMTP authentication step.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT#EUSER=[<eUser>]

Parameter:

| Name | Type | Default | Description |
|---------|--------|---------|---|
| <eUser> | string | "" | string containing the e-mail authentication User ID |

Value:

"" : factory default

-  If no authentication is required then the <eUser> parameter must be the empty string "".

AT#EUSER?

Read command returns the value of the current user identification string <e-user>, in the format:

#EUSER: <eUser>

AT#EUSER=?

Test command returns the maximum allowed length of the string parameter <eUser>

```
AT#EUSER="myE-Name"  
OK
```

```
AT#EUSER?  
#EUSER: "myE-Name"  
OK
```

3.17.7. AT#EMAILD - E-mail Sending

This command sends an e-mail message.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#EMAILD=[<da>,<subj>]

A PDP context shall have been activated through **AT#SGACT=x,1**. The context "x" is the one used by SMTP, as specified by **#SMTPCFG** command. After command line is terminated with **<CR>**, the device responds sending a four character sequence prompt:

<CR><LF><greater_than><space> (see IRA character set: 13, 10, 62, 32)

To complete the operation, send **Ctrl-Z** char (**0x1A** hex). To exit without completing the operation send **ESC** char (**0x1B** hex).

If the e-mail message is successfully sent, then the response is **OK**. If message sending fails for some reason, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|---------------------|--------|---------|---|
| <da> | string | - | destination address (maximum length 100 characters). |
| <subj> | string | - | subject of the message (maximum length 100 characters). |

- i** If the length of one of the string type parameters exceeds the maximum length, then module returns an error indication.
- i** Care must be taken to ensure that during the command execution, no other commands are issued: to avoid malfunctions it is suggested to wait for the **OK** or **ERROR / +CMS ERROR:<err>** response before issuing further commands.

-
-  Maximum length for message body is 1500: trying to send more data will cause the surplus to be discarded and lost.
-

AT#EMAILD=?

Test command returns **OK** result code.

 `AT#EMAILD="me@myaddress.com","subject of the mail"`
`>message body... . This is the text of the mail message`
`CTRL-Z`
`... wait...`
`OK`
Message has been sent.

3.17.8. AT#EPASSW - E-mail Authentication Password

This command sets the password string to be used during the authentication step of the SMTP.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#EPASSW=[<ePwd>]

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|---|
| <ePwd> | string | "" | e-mail authentication password that can have any string value up to max length reported by test command |

Value:

"" : factory default

-  If no authentication is required then the <ePwd> parameter shall be empty "".

AT#EPASSW=?

Test command returns the maximum allowed length of the string parameter <ePwd>.

```
</> AT#EPASSW="myPassword"
OK
```

3.17.9. AT#EADDR - E-mail Sender Address

This command sets the sender address string to be used for sending the e-mail.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#EADDR=[<eAddr>]

Parameter:

| Name | Type | Default | Description |
|---------|--------|---------|---|
| <eAddr> | string | "" | sender address. This parameter can be set to any string with any length up to the one reported by the test command. |

Value:

"" : default value

AT#EADDR?

Read command reports the current sender address, in the format:

#EADDR: <eAddr>

AT#EADDR=?

Test command returns the maximum allowed length of the string parameter <eAddr>.

The examples describe how to set and get the sender e-mail address.

- Set the sender e-mail address.
`AT#EADDR="me@email.box.com"`
OK
- Get sender e-mail address.
`AT#EADDR?`
`#EADDR: "me@email.box.com"`
OK

| | | | |
|----------------------------|---------|-----|--|
| | | | "m2mlocate.telit.com" for third profile |
| <server_port> | integer | N/A | select TCP remote port. 75. for first and second profile 80, by default 76. for third profile 9978, by default |
| | | | Value: 1÷65535 : TCP remote port of the HTTP server to connect to |
| <auth_type> | integer | 0 | select HTTP authentication type. |
| | | | Values: 0 : no authentication 1 : basic authentication |
| <username> | string | - | configure authentication user identification string for HTTP. |
| <password> | string | - | configure authentication password string for HTTP. |
| <ssl_enabled> | integer | 0 | enable/disable SSL encryption. |
| | | | Values: 0 : SSL encryption disabled 1 : SSL encryption enabled |
| <timeout> | integer | 120 | timeout, data from HTTPS server. |
| | | | Value: 1÷65535 : time interval in seconds to wait for receiving data from HTTP server. |

| | | | |
|-------------------------|---------|---|---|
| <cid> | integer | - | PDP context identifier. See +CGDCONT command. |
| <pkt_size> | integer | 0 | size for data sending (#HTTPSND) or receiving (#HTTPRCV). |
| Values: | | | |
| 0 | : | | select automatically value 300 |
| 1÷1500 | : | | send or receive size in bytes |
| <unused1> | integer | - | parameter for future use. Must be set to 0. |
| <unused2> | integer | - | parameter for future use. Must be set to 0. |

- i** A special form of the set command, **AT#HTTPCFG=<prof_id>**, causes the values for profile number **<prof_id>** to reset to default values.
- i** Only one profile can use the SSL encryption.

AT#HTTPCFG?

Read command returns the current settings for each defined profile in the format:
#HTTPCFG:<prof_id>,<server_address>,<server_port>,<auth_type>,<username>,<password>,<ssl_enabled>,<timeout>,<cid>,<pkt_size>,0,0<CR><LF>[<CR><LF>

#HTTPCFG:<prof_id>,<server_address>,<server_port>,<auth_type>,<username>,<password>,<ssl_enabled>,<timeout>,<cid>,<pkt_size>,0,0]<CR><LF>[...]

AT#HTTPCFG=?

Test command returns the supported range of parameters **<prof_id>**, **<server_port>**, **<auth_type>**, **<ssl_enabled>**, **<timeout>**, **<cid>**, **<pkt_size>**, **<unused1>**, **<unused2>**, and the maximum length of **<server_address>**, **<username>** and **<password>** parameters in the format:

#HTTPCFG:(list of supported <prof_id>s),<s_length>,(list of supported <server_port>s), (list of supported <auth_type>s),<u_length>,<p_length>,(list of supported <ssl_enabled>s),(list of supported <timeout>s),(list of supported <cid>s),(list of supported <pkt_size>s),(0),(0)

Additional info:

- ▶▶ Meaning of the <..._length> parameters:

| Name | Type | Default | Description |
|------------|---------|---------|--|
| <s_length> | integer | - | maximum length of parameter <server_address> |
| <u_length> | integer | - | maximum length of parameter <username>. |
| <p_length> | integer | - | maximum length of parameter <password>. |

3.18.2. AT#HTTPQRY - Send HTTP GET, HEAD or DELETE Request

This command performs a GET, HEAD or DELETE request to HTTP server.

Standard RFC 2616

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#HTTPQRY=<prof_id>,<command>,<resource>[,<extra_header_line>]

Parameters:

| Name | Type | Default | Description |
|----------------------------------|---------|---------|--|
| <prof_id> | integer | N/A | profile identifier |
| | Value: | | |
| | 0÷2 | : | identifier values |
| <command> | integer | 0 | identifies command requested to HTTP server |
| | Values: | | |
| | 0 | : | GET |
| | 1 | : | HEAD |
| | 2 | : | DELETE |
| <resource> | string | - | is the HTTP resource (URI), object of the request. It must always start with "/" (slash character) |
| <extra_header_line> | string | - | is the optional HTTP header line |

Additional info:

- ▶▶ When the HTTP server answer is received, then the following URC is put on the serial port:

#HTTPRING:

<prof_id>,<http_status_code>,<content_type>,<data_size>

If there are no data from server or the server does not answer within the time interval specified in **<timeout>** parameter of **#HTTPCFG** command, then the URC **#HTTPRING** **<http_status_code>** parameter has value 0.

| Name | Type | Default | Description |
|---------------------------------|--------|---------|---|
| <http_status_code> | string | - | is the status code, as received from the server, see RFC 2616 |
| <content_type> | string | - | reports the "Content-Type" header line, as received from the server, see RFC 2616 |
| <data_size> | string | - | is the byte amount of data received from the server. If the server does not report the "Content-Length:" header line, the parameter value is 0. |

- ▶▶ To set more than one HTTP header line in parameter **<extra_header_line>**, they have to be separated by ">>"

Example:

AT#HTTPQRY=0,0,"myURI","Content-Type: xyz">>Authorization: something"

Where:

"myURI" must always start with "/" (slash).

Here an example where **#HTTPQRY** requests for the homepage of `www.myhost.com`:

```
AT#HTTPCFG=0,"www.myhost.com",80
OK
AT#HTTPQRY=0,0,"/"
OK
```

- i** If sending ends successfully, the response is **OK**; otherwise an error code is reported.

The HTTP request header sent with **#HTTPQRY** always contains the "Connection: close" line, and it cannot be removed.

AT#HTTPQRY=?

Test command reports the supported range of values for the parameters **<prof_id>** and **<command>** and the maximum length of **<resource>** parameter in the format:

#HTTPQRY:(list of supported <prof_id>s),(list of supported <command>s),<r_length>, <m_length>

Additional info:

- ▶▶ Meaning of **<..._length>** parameters:

| Name | Type | Default | Description |
|-------------------------|---------|---------|--|
| <r_length> | integer | - | maximum length of parameter <resource> . |
| <m_length> | integer | - | maximum length of parameter <extra_header_line> . |

3.18.3. AT#HTTPSND - Send HTTP POST or PUT request

This command performs a POST or PUT request to HTTP server and starts sending data to the server.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#HTTPSND=<profilid>,<command>,<resource>,<dataLen>[,<postParam>[,<extraHeaderLine>]]

After entering **AT#HTTPSND=...** command, and terminated the command line with <CR>, the module returns the following three characters sequence prompt, and waits for data to send:

<greater_than><greater_than><greater_than> (see IRA character set: 62, 62, 62)

Now, data can be entered from TE, sized <dataLen> bytes. If sending ends successfully the response will be **OK**, otherwise an error code will be reported.

When the HTTP server answer is received, the URC will be available on the serial port with the following format:

#HTTPRING: <profilid>,<httpStatusCode>,<contentType>,<dataSize>

The URC parameters are described in Unsolicited Field section.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|----------------------------------|
| <profilid> | integer | N/A | profile identifier |
| | Value: | | |
| | 0÷2 | : | profile identifier |
| <command> | integer | N/A | command requested to HTTP server |

Values:

0 : POST command

1 : PUT command

| | | | |
|--------------------------|---------|-----|--|
| <resource> | string | - | HTTP resource (uri), object of the request |
| <dataLen> | integer | - | data length to send in bytes |
| <postParam> | string | N/A | HTTP Content-type identifier, used only for POST command, optionally followed by colon character (:) and a string that extends with sub-types the identifier |

Values:

0[:extension] : "application/x-www-form-urlencoded" with optional extension

1[:extension] : "text/plain" with optional extension

2[:extension] : "application/octet-stream" with optional extension

3[:extension] : "multipart/form-data" with optional extension

other : free string corresponding to other content type and possible sub-types

| | | | |
|--------------------------------|--------|---|---------------------------|
| <extraHeaderLine> | string | - | optional HTTP header line |
|--------------------------------|--------|---|---------------------------|

Unsolicited fields:

| Name | Type | Description |
|-------------------------------|---------|---|
| <httpStatusCode> | integer | status code, as received from the server (see RFC 2616) |

| | | |
|----------------------------|---------|---|
| <contentType> | string | "Content-Type" header line, as received from the server (see RFC 2616) |
| <dataSize> | integer | byte amount of data received from the server (if the server doesn't report the "Content-Length:" header line, the parameter value is 0) |

- i** The HTTP request header sent with **#HTTPSND** always contains the "Connection: close" line, and it cannot be removed.
- i** If there are no data from server or the server doesn't answer within the time interval specified in **<timeout>** parameter of **#HTTPCFG** command, then the URC **#HTTPRING** **<http_status_code>** parameter will have value 0.

AT#HTTPSND=?

Test command returns the supported range of parameters **<profilId>**, **<command>** and **<dataLen>** and the maximum length of **<resource>**, **<postParam>** and **<extraHeaderLine>** string parameters in the format:

HTTPSND: (list of supported **<profilId>s**),(list of supported **<command>s**), **<rLength>**, (list of supported **<dataLen>s**),**<pLength>**,**<mLength>**

Additional info:

- ▶▶ **<...Length>** parameters meaning:

| Name | Type | Default | Description |
|------------------------|---------|---------|--|
| <rLength> | integer | - | maximum length of parameter <resource> |
| <pLength> | integer | - | maximum length of parameter <postParam> |
| <mLength> | integer | - | maximum length of parameter <extraHeaderLine> |

POST commands examples.

- Post 100 byte without "Content-type" header
AT#HTTPSND=0,0,"/",100
>>>
- Post 100 byte with "application/x-www-form-urlencoded"
AT#HTTPSND=0,0,"/",100,0
>>>
- Post 100 byte with "multipart/form-data" and extension
AT#HTTPSND=0,0,"/",100,"3:boundary=----FormBoundary"
>>>

3.18.4. AT#HTTTPRCV - Receive HTTP Server Data

This command permits the user to read data from HTTP server in response to a previous HTTP module request.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#HTTTPRCV=<profilId>[,<maxByte>]

The module is notified of these data by the **#HTTTPRING** URC.

The device shall prompt a three-character sequence followed by the data:

<less_than><less_than><less_than> (see IRA character set: 60,60,60)

If reading ends successfully, the response is **OK**; otherwise an error code is reported.

Parameters:

| Name | Type | Default | Description |
|------------|---------|---------|---------------------------------------|
| <profilId> | integer | N/A | profile identifier |
| | Value: | | |
| | 0÷2 | : | profile identifier |
| <maxByte> | integer | 0 | max number of bytes to read at a time |
| | Value: | | |
| | 0, | : | 0 means infinite size. |
| | 64÷1500 | | |

-  If <maxByte> is unspecified, server data will be transferred all in once.

-
-  If the data are not present or the **#HTTTPRING** `<httpStatusCode>` parameter has value 0, an error code is reported.
-

AT#HTTTPRCV=?

Test command reports the supported range of values for `<profilId>` and `<maxByte>` parameters in the format:

HTTPRCV: (list of supported `<profilId>s,<maxByte>`)

3.19. SSL

3.19.1. AT#SSLCFG - Configure General Parameters of a SSL Socket

This command configures SSL connection parameters.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT#SSLCFG=<SSId>,<cid>,<pktSz>,<maxTo>,<defTo>,<txTo>[,<SSLSRingMode>[,<noCarrierMode>[,<skipHostMismatch>[,<equalizeTX>[,<connTo>[,<Unused1>]]]]]]]**

Set command allows configuring SSL connection parameters.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|--|
| <SSId> | integer | 1 | Secure Socket Identifier |
| Value: | | | |
| 1 : Until now SSL block manages only one socket | | | |
| <cid> | integer | - | PDP context identifier, see +CGDCONT command. |
| <pktSz> | integer | 0 | packet size to be used by the SSL/TCP/IP stack for data sending |
| Values: | | | |
| 0 : select automatically default value (300) | | | |
| 1÷1500 : number of bytes | | | |
| <maxTo> | integer | 90 | exchange timeout or socket inactivity timeout. In online mode, if there is no data |

exchange within this timeout period, the connection is closed.

Values:

0 : no timeout

1÷65535 : timeout in seconds

| | | | |
|----------------------|---------|-----|---|
| <defTo> | integer | 100 | timeout that will be used by default whenever the corresponding parameter of each command is not set. |
|----------------------|---------|-----|---|

Value:

10÷5000 : timeout in tenth of seconds

| | | | |
|---------------------|---------|----|--|
| <txTo> | integer | 50 | data sending timeout. In online mode, after this period data are sent also if they're less than max packet size. |
|---------------------|---------|----|--|

Values:

0 : no timeout

1÷255 : timeout value in hundreds of milliseconds

| | | | |
|-----------------------------|---------|---|--------------------------|
| <SSLSRingMode> | integer | 0 | SSLRING unsolicited mode |
|-----------------------------|---------|---|--------------------------|

Values:

0 : disable

1 : enable decoded data format, see Additional info section

2 : enable chunk of data format, see Additional info section

| | | | |
|------------------------------|---------|---|---|
| <noCarrierMode> | integer | 0 | selects the NO CARRIER indication format when the secure socket is closed. |
|------------------------------|---------|---|---|

Values:

- 0 : NO CARRIER without additional information
- 1 : NO CARRIER:SSL,<SSId> See Additional info section
- 2 : NO CARRIER:SSL,<SSId>,<cause> See Additional info section

| | | | |
|---------------------------------|---------|---|--------------------------------------|
| <skipHostMismatch> | integer | 1 | enables/disables Host Mismatch alert |
|---------------------------------|---------|---|--------------------------------------|

Values:

- 0 : do not ignore
- 1 : ignore

| | | | |
|---------------------------|---------|---|--|
| <equalizeTX> | integer | 0 | enable/disable equalized data transmission |
|---------------------------|---------|---|--|

Values:

- 0 : disable equalized data transmission
- 1 : enable equalized data transmission, i.e.: after successful data write for sending on SSL connection, next check for available <pktSz> data is triggered after <txTo>

| | | | |
|-----------------------|---------|---|---|
| <connTo> | integer | 0 | Connection timeout in tenths of seconds. If the SSL connection to the remote cannot be established within this timeout period, an error is raised. |
|-----------------------|---------|---|---|

Values:

- 0 : the timeout is managed by TCP/IP and SSL stack
 - 10÷1200 : timeout value
-

<Unused1> integer - parameter for future use.
Must be set to 0.

Additional info:

- ▶▶ When **<SSLSRingMode>= 1** a new unsolicited is sent whenever the amount of data ready to be read changes, the unsolicited format is:

SSLSRING: <SSId>,<recData>

<recData> is described in the Unsolicited fields section.

- ▶▶ When **<SSLSRingMode>= 2** the unsolicited format is:

SSLSRING: <SSId>,<dataLen>,<data>

<dataLen> and **<data>** are described in the Unsolicited fields section.

- ▶▶ The **NO CARRIER** indication can be followed by additional information:

NO CARRIER:SSL,<SSId>

NO CARRIER:SSL,<SSId>,<cause>

The fixed "SSL" string distinguishes secure sockets from TCP sockets.

| Name | Type | Default | Description |
|----------------------|---------|---------|------------------------------------|
| <cause> | integer | N/A | cause of the secure socket closure |
| Values: | | | |

- 0 : not available (secure socket has not yet been closed)
- 1 : the remote TCP connection has been closed (RST, or any fatal error in send/rcv are all included within this case)
- 2 : socket inactivity timeout
- 3 : network deactivation (PDP context deactivation from network)
- 4 : SSL "Close Notify Alert" message has been received
- 5 : the remote TCP connection has been closed (FIN) after all data have been retrieved from socket
- 6 : closure due to any other SSL alert different from the previous ones

Unsolicited fields:

| Name | Type | Description |
|-----------|---------|--|
| <recData> | integer | number of bytes available to be read from the TLS/SSL record that is currently being processed (obviously: already decoded from TLS/SSL record) plus the number of bytes available to be read in the TCP/IP stack. |
| <dataLen> | integer | length of the current chunk of data in bytes |
| <data> | hex | received data in ASCII format |

- i** If secure socket is not enabled using **#SSLEN** only test requests can be made.
- i** This version of command reordered the parameters of the command, so this is not interchangeable with previous version

AT#SSLCFG?

Read command reports the parameters current values in the format:

```
#SSLCFG:<SSId>,<cid>,<pktSz>,<maxTo>,<defTo>,<txTo>,<SSLSRingMode>,<noCarrierMode>,<skipHostMismatch>,<equalizeTX>,0,0
```

?  AT#SSLCFG=?

Test command reports the ranges of all parameters values.

3.19.2. AT#SSLSECCFG - Configure Security Parameters of a SSL Socket

This command allows configuring SSL connection parameters.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SSLSECCFG=<SSId>,<CipherSuite>,<auth_mode>**

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |

Value:

1 : Until now only one SSL socket is available

| | | | |
|---------------|---------|---|--|
| <CipherSuite> | integer | 0 | identify the cipher suite. The <CipherSuite> parameter is expressed in decimal and hex format to identify different cipher suites. |
|---------------|---------|---|--|

The cipher suites identified by <CipherSuite> parameters expressed in decimal format are listed in the Value section right below.

The cipher suites identified by <CipherSuite> (RCF) values expressed in hex format are listed in the Additional info section.

Values:

0 : cipher suite is chosen by remote server among the following:
 TLS_RSA_WITH_AES_128_CBC_SHA,

TLS_RSA_WITH_AES_256_CBC_SHA,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA,
 TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
 TLS_RSA_WITH_AES_128_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
 TLS_RSA_WITH_AES_256_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_256_CBC_SHA256

- 1 : TLS_RSA_WITH_RC4_128_MD5, not available because obsolete
- 2 : TLS_RSA_WITH_RC4_128_SHA, not available because obsolete
- 3 : TLS_RSA_WITH_AES_128_CBC_SHA
- 4 : TLS_RSA_WITH_NULL_SHA, not available because obsolete
- 5 : TLS_RSA_WITH_AES_256_CBC_SHA
- 6 : TLS_RSA_WITH_3DES_EDE_CBC_SHA, not available because obsolete
- 7 : TLS_DHE_RSA_WITH_AES_128_CBC_SHA
- 8 : TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA, not available because obsolete
- 9 : TLS_DHE_RSA_WITH_AES_256_CBC_SHA
- 10 : TLS_RSA_WITH_AES_128_CBC_SHA256
- 11 : TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
- 12 : TLS_RSA_WITH_AES_256_CBC_SHA256
- 13 : TLS_DHE_RSA_WITH_AES_256_CBC_SHA256

<auth_mode> integer 0 authentication mode

Values:

- 0 : SSL Verify None
-

- 1 : manage server authentication
- 2 : manage server and client authentication if requested by the remote server

Additional info:

►► The first column shows the <CipherSuite> (RCF) values expressed in hex format, the second column indicates the related cipher suite name.

| | |
|--------|---|
| 0x002F | : TLS_RSA_WITH_AES_128_CBC_SHA |
| 0x0033 | : TLS_DHE_RSA_WITH_AES_128_CBC_SHA |
| 0x0035 | : TLS_RSA_WITH_AES_256_CBC_SHA |
| 0x0039 | : TLS_DHE_RSA_WITH_AES_256_CBC_SHA |
| 0x003C | : TLS_RSA_WITH_AES_128_CBC_SHA256 |
| 0x003D | : TLS_RSA_WITH_AES_256_CBC_SHA256 |
| 0x0067 | : TLS_DHE_RSA_WITH_AES_128_CBC_SHA256 |
| 0x006B | : TLS_DHE_RSA_WITH_AES_256_CBC_SHA256 |
| 0x008A | : TLS_PSK_WITH_RC4_128_SHA |
| 0x008B | : TLS_PSK_WITH_3DES_EDE_CBC_SHA |
| 0x008C | : TLS_PSK_WITH_AES_128_CBC_SHA |
| 0x008D | : TLS_PSK_WITH_AES_256_CBC_SHA |
| 0x009C | : TLS_RSA_WITH_AES_128_GCM_SHA256 |
| 0x009D | : TLS_RSA_WITH_AES_256_GCM_SHA384 |
| 0x009E | : TLS_DHE_RSA_WITH_AES_128_GCM_SHA256 |
| 0x009F | : TLS_DHE_RSA_WITH_AES_256_GCM_SHA384 |
| 0x00A8 | : TLS_PSK_WITH_AES_128_GCM_SHA256 |
| 0x00A9 | : TLS_PSK_WITH_AES_256_GCM_SHA384 |
| 0x00AE | : TLS_PSK_WITH_AES_128_CBC_SHA256 |
| 0x00AF | : TLS_PSK_WITH_AES_256_CBC_SHA384 |
| 0xC004 | : TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA |
| 0xC005 | : TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA |
| 0xC009 | : TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA |
| 0xC00A | : TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA |
| 0xC00E | : TLS_ECDH_RSA_WITH_AES_128_CBC_SHA |
| 0xC00F | : TLS_ECDH_RSA_WITH_AES_256_CBC_SHA |
| 0xC013 | : TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA |
| 0xC014 | : TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA |
| 0xC023 | : TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 |
| 0xC024 | : TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 |
| 0xC025 | : TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA256 |

0xC026 : TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384
0xC027 : TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256
0xC028 : TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384
0xC029 : TLS_ECDH_RSA_WITH_AES_128_CBC_SHA256
0xC02A : TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384
0xC02B : TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
0xC02C : TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
0xC02D : TLS_ECDH_ECDSA_WITH_AES_128_GCM_SHA256
0xC02E : TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384
0xC02F : TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
0xC030 : TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
0xC031 : TLS_ECDH_RSA_WITH_AES_128_GCM_SHA256
0xC032 : TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384
0xC0A0 : TLS_RSA_WITH_AES_128_CCM_8
0xC0A1 : TLS_RSA_WITH_AES_256_CCM_8
0xC0A2 : TLS_DHE_RSA_WITH_AES_128_CCM_8
0xC0A3 : TLS_DHE_RSA_WITH_AES_256_CCM_8
0xCCA8 : TLS_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256
0xCCA9 : TLS_ECDHE_ECDSA_WITH_CHACHA20_POLY1305_SHA256
0xCCAA : TLS_DHE_RSA_WITH_CHACHA20_POLY1305_SHA256

-  Server CA certificate must be stored through **#SSLSECDATA**.
-  Setting an obsolete cipher suite have the same effect as setting it to 0.
-  If secure socket is not enabled using **#SSLEN** command, only test command can be used.

AT#SSLSECCFG?

Read command reports the currently selected parameters in the format:

#SSLSECCFG: <SSId>,<CipherSuite>,<auth_mode>

Read command returns **ERROR** if secure socket has not been enabled using **#SSLEN** command.

 **AT#SSLSECCFG=?**

Test command returns the range of supported values for all the parameters.

3.19.3. AT#SSLSECCA - Manage the Security Data

This command stores, reads, and deletes CA Certificates in / from NVM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SSLSECCA=<CertId>,<action>,<dataType>[,<size>[,<Unused_A>[,<Unused_B>]]]**

Parameters:

| Name | Type | Default | Description |
|------------------------------|---------|---------|---|
| <CertId> | integer | 1 | Secure Socket Identifier |
| Values: | | | |
| 1 : Certificate Identifier 1 | | | |
| 2 : Certificate Identifier 2 | | | |
| 3 : Certificate Identifier 3 | | | |
| <action> | integer | 0 | required action |
| Values: | | | |
| 0 : delete data from NVM | | | |
| 1 : store data in NVM | | | |
| 2 : read data from NVM | | | |
| <dataType> | integer | 1 | security data type |
| Value: | | | |
| 1 : CA certificate | | | |
| <size> | integer | N/A | size of security data to be stored; the parameter is mandatory if write action is |

issued, it can be omitted for delete or read actions.

Value:

1÷4095 : size of security data to be stored

Additional info:

▶▶ Store security data in NVM

<action>=1 specifies the storing in NVM, <size> parameter is mandatory. After command line is terminated with <CR>, the command returns the following four-characters sequence prompt:

<CR><LF><greater_than><space> [see IRA 13, 10, 62, 32]

and waits for data to be stored. Security data must be in PEM format:

77. to end the secured data editing, enter Ctrl-Z char (0x1A hex)

78. to exit without writing the message, enter ESC char (0x1B hex)

If data are successfully stored, the command returns **OK**, otherwise an error code is reported.

▶▶ Read security data from NVM

<action>=2 specifies the reading from NVM, the <size> parameter is not mandatory. The command returns the following message:

#SSLSECCA: <CertId>,<dataType>

<DATA>

OK

▶▶ Select which CA certificate to use

With **AT#SSLSECCFG2** it is possible to select which CA certificate of <CertId> to use for the next SSL connection.

Maximum 3 certificate between <preloadedCA> and <customCA> must be selected.

- i** If secure socket has not been enabled through **#SSLEN** command, only test command can be used
- i** If socket is connected an error code is reported
- i** Only "rsa_sign" certificates are supported by the Telit Module in client authentication.
- i** CA certificate stored in NVM
CA certificates stored in NVM are shared among all secure sockets <SSId>s

AT#SSLSECCA?

Read command reports what security data are stored for each <CertId>. The returned message has the following format:

#SSLSECCA: <CertId>,0,<CACertIsSet>,0,,0

#SSLSECCA: <CertId>,0,<CACertIsSet>,0,,0

<CACertIsSet> is 1 if related data are stored into NVM, 0 otherwise.

Additional info:

- ▶ This Additional info section describes the parameters, if not described in the previous sections, returned by the **AT#SSLSECDATA?** read command

| Name | Type | Default | Description |
|---------------|---------|---------|---|
| <CACertIsSet> | integer | 0 | identifies the CA certificate presence in the NVM |

Values:

0 : not present

1 : present

?  **AT#SSLSECCA=?**

Test command returns the supported values for the parameters <CertId>, <action>, <dataType> and <size>.

```
Store CA certificate 1 for www.site1.com for <CertId> 1
#SSLSECCA=1,1,1,<len>
>...
```

```
Store CA certificate 2 for www.site2.com for <CertId> 2
#SSLSECCA=2,1,1,<len>
>...
```

```
Set to use <CertId> 1 and 2
#SSLSECCFG2=1,4,0,3,0
>...
```

```
Connect
#SSLD=1,443,"www.site1.com",...
CONNECT
+++
OK
```

```
AT#SSLH=1
OK
```

```
Connect
#SSLD=2,443,"www.site2.com",...
CONNECT
+++
OK
```

3.19.4. AT#SSLEN - Enable a SSL Socket

This command activates/deactivates a socket secured by SSL.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SSLEN=<SSId>,<Enable>

Parameters:

| Name | Type | Default | Description |
|----------------------------------|---------|---------|-----------------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |
| Value: | | | |
| 1 : only one socket is available | | | |
| <Enable> | integer | 0 | activate/deactivate secure socket |
| Values: | | | |
| 0 : deactivate | | | |
| 1 : activate | | | |

-  If the unique available secure socket is not activated, all the commands - belonging to the SSL set (example: **#SSLSECDATA**, **#SSL...**, etc.) and different from test commands - return an error message. **#SSLS** command is an exception, it can be issued also if the socket is deactivated.
-  If the unique available secure socket is connected, it cannot be deactivated issuing **AT#SSLEN=1,0**.

AT#SSLEN?

Read command reports the current status of secure socket in the format:

#SSLEN: <SSId>,<Enable>
OK

AT#SSLEN=?

Test command returns the range of supported values for all the parameters:

#SSLEN: (1),(0,1)

3.19.5. AT#SSLD - Open a SSL Socket to a Remote Server

This command opens a remote connection via socket secured through SSL.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Other | No | - | 2 |

 **AT#SSLD=<SSId>,<rPort>,<IPAddress>,<ClosureType>[,<connMode>[,<Timeout>]**
]

Execution command opens a remote connection via socket secured through SSL.

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|----------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |
| Value: | | | |
| 1 : Until now only one SSL socket is available | | | |
| <rPort> | integer | 1 | Remote TCP port to contact |
| Value: | | | |
| 1÷65535 : TCP port number | | | |
| <IPAddress> | string | - | address of SSL server. |
| <ClosureType> | integer | 0 | Closure type |
| Value: | | | |
| 0 : Until now only closure type 0 is supported. SSL session id and keys are free. | | | |
| <connMode> | integer | 1 | connection mode |
| Values: | | | |

- 0 : online mode connection, see Additional info section.
- 1 : command mode connection, see Additional info section.

| | | | |
|-----------|---------|-----|---|
| <Timeout> | integer | 100 | <p>It represents the maximum allowed TCP inter-packet delay. It means that, when more data is expected during the handshake, the module awaits <Timeout> * 100 msec for the next packet. If no more data can be read, the module gives up the handshake and raises an ERROR response.</p> <p><Timeout> is the total handshake timeout or, in other words, it is not the absolute maximum time between the #SSLD issue and the CONNECT/OK/ERROR response. Though by changing this parameter you can limit the handshake duration (for example in case of congested network or busy server), there is no way to be sure to get the command response within a certain amount of time, because it depends on the TCP connection time, the handshake time and the computation time (which depends on the authentication mode and on the size of keys and certificates).</p> |
|-----------|---------|-----|---|

Value:

1÷5000 : hundreds of ms

Additional info:

▶▶ <connMode>=0: online mode connection

If <connMode> is set to **online mode connection** and the command is successful, the module enters into **online data mode** and returns the

intermediate result code **CONNECT**. After the **CONNECT**, you can suspend the direct interface to the socket connection (the socket stays open) using the escape sequence (**+++**): the module moves back to **command mode** and returns the final result code **OK** after the suspension.

After such a suspension, it is possible to resume it by using the **#SSLO** command with the corresponding **<connId>**.

►► **<connMode>=1**: command mode connection

If **<connMode>** is set to **command mode connection** and the command is successful, the socket is opened, the module remains in **command mode** and returns result code **OK**.

- ❗ If secure socket is not enabled using **#SSLEN** only test requests can be made.
- ❗ If timeout is not set for SSL connection the default timeout value, set by **#SSLCFG**, is used.
- ❗ In online mode the socket is closed after an inactivity period (configurable with **#SSLCFG**, with a default value of 90 seconds), and the **NO CARRIER** message is printed.
- ❗ In online mode data are transmitted as soon as the data packet size is reached or as after a transmission timeout. Both these parameters are configurable by using **#SSLCFG**.
- ❗ Before opening a SSL connection, the PDP context must have been activated by **#SGACT=x,1**
- ❗ Before opening a SSL connection, make sure to have stored the needed secure data (CA certificate), using **#SSLSECDATA**, for the security level set through **AT#SSLSECCFG**.
- ❗ The PDP context definition that will be used, is set by **AT#SSLCFG** command

 **AT#SSLD=?**

Test command returns the range of supported values for all the parameters:

```
#SSLD: (1),(1-65535),,(0),(0,1),(1-5000)
```

See the following examples:

- Start online mode:

```
AT#SSLD =1,8500,"84.94.194.21",0,1  
OK  
CONNECT
```
- Start command mode:

```
AT#SSLD=1,8500,"84.94.194.21",1,1  
OK
```
- Configure correct PDP context with AT#SSLCFG command:

```
AT#SGACT=3,1  
#SGACT: XX.XXX.XXX.XXX  
OK
```

Note the second parameter of #SSLCFG

```
AT#SSLCFG=1,3,300,90,100,50,0,0,0,0  
OK  
AT#SSLD=1,<port>,"IP or URL",0,1  
OK  
CONNECT
```

3.19.6. AT#SSLO - Restore a SSL Socket after a +++

This command restores a SSL connection (online mode) suspended by an escape sequence (+++).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SSLO=<SSId>

This command restores a SSL connection (online mode) suspended by an escape sequence (+++). After the connection restore, the **CONNECT** message is printed. Please note that this is possible even if the connection has been started in command mode (**#SSLD** with **<connMode>=1**).

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |

Value:

1 : only one socket is available.

- i** If secure socket has not be enabled through **#SSLEN** command, only test command can be used.
- i** Before opening a SSL connection, the PDP context must have been activated by **AT#SGACT=X,1**.
- i** If an error occurs during reconnection the socket cannot be reconnected, then a new connection has to be done.

AT#SSLO=?

Test command returns the range of supported values for all the parameters:

#SSLO: (1)

3.19.7. AT#SSLH - Close a SSL Socket

This command allows closing the SSL connection.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SSLH=<SSId>[,<ClosureType>]

Parameters:

| Name | Type | Default | Description |
|----------------------------------|---------|---------|--------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |
| Value: | | | |
| 1 : only one socket is available | | | |
| <ClosureType> | integer | 0 | type of socket closure. |
| Value: | | | |
| 0 : only value 0 is supported | | | |

-  If secure socket has not be enabled through **#SSLEN** command, only test command can be used.

AT#SSLH=?

Test command returns the range of supported values for all the parameters:

#SSLH: (1),(0)

3.19.8. AT#SSLSEND - Send Data through a SSL Socket

This command allows sending data through a secure socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SSLSEND=<SSId>[,<Timeout>]

Parameters:

| Name | Type | Default | Description |
|----------------------------------|---------|---------|--------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |
| Value: | | | |
| 1 : only one socket is available | | | |
| <Timeout> | integer | 100 | socket send timeout |
| Value: | | | |
| 1÷5000 : timeout in 100 ms units | | | |

Additional info:

- ▶ After command line is terminated with <CR>, the command returns the following four-character sequence prompt:

<CR><LF><greater_than><space> (IRA 13, 10, 62, 32)

and waits for the data to be send.

79. to end the data editing and start the sending, enter Ctrl-Z char (0x1A hex). The maximum number of bytes to send is 1023, trying to send more data will cause the data excess to be discarded and lost.
80. to exit without sending the message, enter ESC char (0x1B hex).

If data are successfully sent, the command returns **OK**. If data sending fails, an error code is reported.

-  If secure socket has not be enabled through **#SSLEN** command, only test command can be used.
-  If timeout is not set for SSL connection, is used the timeout value set by **#SSLCFG**.
-  Before sending data through the SSL connection, it must be established using **#SSLD**.

AT#SSLSEND=?

Test command returns the range of supported values for all the parameters.

3.19.9. AT#SSLRECV - Read Data from a SSL Socket

This command reads data from a SSL socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SSLRECV=<SSId>,<MaxNumByte>[,<Timeout>]

Set command allows to receive data, arrived through a connected secure socket. Data has been buffered and not read yet.

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|---------------------------------|
| <SSId> | integer | 1 | secure socket identifier |
| Value: | | | |
| 1 : until now only one SSL socket is supported | | | |
| <MaxNumByte> | integer | N/A | maximum number of bytes to read |
| Value: | | | |
| 1÷1000 : maximum number of bytes to read | | | |
| <Timeout> | integer | 100 | time-out in 100 ms units |
| Value: | | | |
| 1÷5000 : hundreds of ms | | | |

Additional info:

- ▶▶ If data are received, the device responds:

```
#SSLRCV: NumByteRead
...(Data read)...
OK
```

- ▶▶ If no data are received, the device responds:

```
#SSLRCV: 0
TIMEOUT
OK
```

- ▶▶ If the remote host closes the connection, the device responds:

```
#SSLRCV: 0
DISCONNECTED
OK
```

- i** If secure socket is not enabled using **AT#SSLEN**, only test requests can be made.
- i** If timeout is not set for SSL connection, the default timeout value, set through **AT#SSLCFG**, is used.
- i** Before receiving data from the SSL connection, it has to be established using **AT#SSLD**.

AT#SSLRCV=?

The test command returns the ranges of the parameters values in the form:

```
#SSLRCV: (1),(1-1000),(10-5000)
```

3.19.10. AT#SSLS - Report the Status of a SSL Socket

This command reports the status of secure sockets.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#SSLS=<SSId>

The command reports the status of secure sockets. The response message of the command can have the following formats:

if secure socket is connected, the format is:

#SSLS: <SSId>,<ConnectionStatus>,<CipherSuite>

otherwise:

#SSLS: <SSId>,<ConnectionStatus>

The response messages parameters are described in the Additional info section.

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|---------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier. |

Value:

1 : only one SSL socket is supported

Additional info:

- List of the meaning of the response message parameters.

| Name | Type | Default | Description |
|---------------|---------|---------|--|
| <CipherSuite> | integer | 0 | identify the cipher suite. The <CipherSuite> parameter is expressed in decimal and hex |

format to identify different cipher suites.

The cipher suites identified by **<CipherSuite>** parameters expressed in decimal format are listed in the Value section right below.

The cipher suites identified by RCF values expressed in hex format are listed in the **#SSLSECCFG** command.

Values:

- 0 : Cipher Suite is chosen by remote Server
- 1 : TLS_RSA_WITH_RC4_128_MD5, not available because obsolete
- 2 : TLS_RSA_WITH_RC4_128_SHA, not available because obsolete
- 3 : TLS_RSA_WITH_AES_256_CBC_SHA, not available because obsolete
- 4 : TLS_RSA_WITH_AES_128_CBC_SHA, not available because obsolete
- 5 : TLS_RSA_WITH_AES_256_CBC_SHA
- 6 : TLS_RSA_WITH_3DES_EDE_CBC_SHA, not available because obsolete
- 7 : TLS_DHE_RSA_WITH_AES_128_CBC_SHA
- 8 : TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA, not available because obsolete
- 9 : TLS_DHE_RSA_WITH_AES_256_CBC_SHA
- 10 : TLS_RSA_WITH_AES_128_CBC_SHA256

11 : TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
 12 : TLS_RSA_WITH_AES_256_CBC_SHA256
 13 : TLS_DHE_RSA_WITH_AES_256_CBC_SHA256

<ConnectionStatus> integer N/A Connection Status identifier

Values:

0 : socket disabled
 1 : connection closed
 2 : connection open

-  This command can be issued even if the **<SSId>** is not enabled.
-  For **<CipherSuite>** values expressed in hex format, refer to **#SSLSECCFG** command

AT#SSLS=?

Test command returns the ranges of the parameters values in format:

#SSLS: {1}

- 
- AT#SSLS=1
#SSLS: 1,1
OK
 - AT#SSLS=1
#SSLS: 1,2,0
OK

3.19.11. AT#SSLI - Secure Socket Info

This command is used to get information about secure socket data traffic.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#SSLI[=<SSId>]

Execution command is used to get information about secure socket data traffic.

The response is in the format:

#SSLI:

<SSId>,<DataSent>,<DataRecv>,<PendingData>,<TCPConnWaitingAck>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------|
| <SSId> | integer | 1 | Secure Socket Identifier |

Value:

1 : only one SSL socket is available

Additional info:

- ▶▶ Parameters returned by the response message and not described in the previous sections.

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <DataSent> | integer | - | total amount (in bytes) of data sent to the TLS/SSL connection since the beginning of the connection itself (obviously: not yet |

| | | | |
|---------------------|---------|-----|--|
| | | | encoded into TLS/SSL record) |
| <DataRecv> | integer | - | total number of bytes received from the TLS/SSL connection since the beginning of the connection itself (obviously: already decoded from TLS/SSL record) |
| <PendingData> | integer | - | number of bytes available to be read from the TLS/SSL record that is currently being processed (obviously: already decoded from TLS/SSL record) plus the number of bytes available to be read in the TCP/IP stack. |
| <TCPConnWaitingAck> | integer | N/A | indication of the underlying TCP socket condition, if there are TCP/IP packets sent but not yet acknowledged or not |

Values:

- 0 : no TCP/IP packets sent waiting for ack
- 1 : TCP/IP packets sent waiting for ack

 AT#SSLI=?

Test command returns the range of supported values for all the parameters.

#SSLI: (1)

3.19.12. AT#SSLSENDEXT - Send Data through a SSL Socket in Command Mode

This command sends data through a secure socket.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#SSLSENDEXT=<SSId>,<bytestosend>[,<Timeout>]

Execution command sends data through a secure socket.

After command line is terminated with <CR>, the command returns the following four-character sequence prompt:

<CR><LF><greater_than><space> [see IRA 13, 10, 62, 32]

and waits for the data to be send.

When <bytestosend> bytes have been sent, the sending is automatically completed. If data are successfully sent, the command returns **OK**. If data sending fails, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|---|
| <SSId> | integer | N/A | Secure Socket Identifier |
| Value: | | | |
| 1 : only one SSL socket is available. | | | |
| <bytestosend> | string | - | number of bytes to be sent. Refer to test command for range |
| <Timeout> | integer | 100 | time-out in 100 ms units. |
| Value: | | | |
| 1÷1500 : hundreds of ms. | | | |

-  If secure socket has not be enabled through **#SSLEN** command, only test command can be used.

-  If timeout is not set for SSL connection, is used the timeout value set by **#SSLCFG**.

-  Before sending data through the SSL connection, it must be established using **#SSLD**.

-  All special characters are sent like a generic byte. For instance: 0x08 BS (Backspace) is sent through the socket, it does not delete the previous character.

AT#SSLSENDEXT=?

Test command returns the range of supported values for parameters **<SSId>**, **<bytestosend>** and **<Timeout>**.

Open the socket in command mode:
AT#SSLD=1,443,<port>,"IP address",0,1
OK

Send data specifying total number of bytes:
AT#SSLSENDEXT=1,256,100
>...

3.19.13. AT#SSLSECDATA - Manage the Security Data

The command stores, reads, and deletes security data (Certificate, CA certificate, private key) in / from NVM.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SSLSECDATA=<CertId>,<action>,<dataType>[,<size>[,<Password>[,<md5When Reading>]]]**

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|----------|---------|---|-------------------------|
| <CertId> | integer | 1 | Certificate Identifier. |
|----------|---------|---|-------------------------|

Values:

- 1 : Certificate identifier number 1
- 2 : Certificate Identifier 2 (Only for CA certificate)
- 3 : Certificate Identifier 3 (Only for CA certificate)
- 4 : Certificate Identifier 4 (Only for CA certificate)

| | | | |
|----------|---------|---|-----------------|
| <action> | integer | 0 | required action |
|----------|---------|---|-----------------|

Values:

- 0 : delete data from NVM
- 1 : store data in NVM
- 2 : read data from NVM
- 3 : store data in RAM

| | | | |
|---|---------|-----|--|
| <dataType> | integer | 0 | security data type |
| Values: | | | |
| 0 : certificate | | | |
| 1 : CA certificate | | | |
| 2 : RSA Private key. Private keys with password are not supported | | | |
| <size> | integer | N/A | size of security data to be stored. The parameter is mandatory if write action is issued, can be omitted for delete or read actions. |
| Value: | | | |
| 1÷4095 : size | | | |
| <Password> | string | - | dummy parameter, unused. |
| <md5WhenReading> | string | 0 | handling of RSA Private key reading when <action> is 2. |
| Values: | | | |
| 0 : RSA Private key is displayed in clear | | | |
| 1 : only RSA Private key MD5 is displayed | | | |

Additional info:

►► Store security data in NVM or in RAM

<action>=1 or 3 specifies the storing in NVM or in RAM, **<size>** parameter is mandatory. After command line is terminated with **<CR>**, the command returns the following four-character sequence prompt:

<CR><LF><greater_than><space> (see IRA 13, 10, 62, 32)

and waits for data to be store. Security data must be in PEM format:

81. to end the secured data editing, enter Ctrl-Z char (0x1A hex)
82. to exit without writing the message, enter ESC char (0x1B hex)

If data are successfully stored, the command returns **OK**, otherwise an error code is reported.

►► Read security data from NVM

<action>=2 specifies the reading from NVM, the <size> parameter is not mandatory. The command returns the following message:

```
#SSLSECDATA: <CertId>,<dataType>  
<DATA>  
OK
```

If the required security data has not been stored in NVM (or it has been deleted) the response has the following format:

```
#SSLSECDATA: <CertId>,<dataType>  
No data stored  
OK
```

►► Select which Ca certificate to use

With **AT#SSLSECCFG2** it is possible to select which CA certificate of <CertId> use for the next SSL connection.

Maximum 3 certificates between <preloadedCA> and <customCA> must be selected.

- ▲ If secure socket has not be enabled through **#SSLEN** command, only test command can be used.

-  If socket is connected an error code is reported.
-  Only "rsa_sign" certificates are supported by the Telit Module in client authentication. The remote server must support this certificate type, otherwise the handshake will fail.
-  CA certificate stored in RAM
 CA certificate is stored in RAM until the related secure socket is not closed. Assume that a secure socket, that was using a CA certificate stored in RAM, has been closed. If the secure socket must be reopened with the same CA certificate, the certificate must be stored again in RAM through the **#SSLSECDATA** command with **<action>=3**. The CA certificate storing in RAM is also permitted when secure sockets are already connected. The new CA certificate will take effect on next **#SSLD=<SSId>...** connection.
-  CA certificate stored in NVM
 CA certificates stored in NVM are shared among all secure sockets **<SSId>s**

AT#SSLSECDATA?

Read command reports what security data are stored for each **<CertId>**. The returned message has the following format:

```
#SSLSECDATA:
<CertId>,<CertIsSet>,<CACertIsSet>,<PrivKeysSet>[,,<md5WhenReading>]
#SSLSECDATA: <CertId>,0,<CACertIsSet>,0[,,<md5WhenReading>]
```

<CertIsSet>, **<CACertIsSet>**, **<PrivKeysSet>** are 1 if related data are stored into NVM otherwise 0.

Additional info:

-  This Additional info section describes the parameters, if not described in the previous sections, returned by the **AT#SSLSECDATA?** read command.

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|--------------------------|---------|---|--|
| <CertIsSet> | integer | 0 | identifies the certificate presence in the NVM |
|--------------------------|---------|---|--|

Values:

0 : not present

1 : present

| | | | |
|----------------------------|---------|---|---|
| <CAcertIsSet> | integer | 0 | identifies the CA certificate presence in the NVM |
|----------------------------|---------|---|---|

Values:

0 : not present

1 : present

| | | | |
|----------------------------|---------|---|--|
| <PrivKeysSet> | integer | 0 | identifies the RSA Private key presence in the NVM |
|----------------------------|---------|---|--|

Values:

0 : not present

1 : present

? AT#SSLSECDATA=?

Test command returns the supported values for the parameters **<CertId>**, **<action>**, **<dataType>** and **<size>**.

Examples

Store CA certificate 1 for www.site1.com in RAM

```
#SSLSECDATA=1,3,1,<len>
```

```
>...
```

Connect #SSLD=1,443,"www.site1.com",...

```
CONNECT
```

```
+++
```

```
OK
```

Store CA certificate 2 for www.site2.com in RAM

```
#SSLSECDATA=1,3,1,<len>
```

```
>...
```

Connect

```
#SSLD=2,443,"www.site2.com",...
```

```
CONNECT
```

```
+++
```

```
OK
```

Now, the socket 1 is closed by the remote side, or by the user (with **#SSLH** command)

To reopen socket 1, enter again **#SSLSECDATA** command for www.site1.com

```
#SSLSECDATA=1,3,1,<len>
```

```
>...
```

Connect

```
#SSLD=1,443,"www.site1.com",...
```

```
CONNECT
```

```
+++
```

```
OK
```

Now, the socket 2 is closed by the remote side, or by the user (with **#SH** command)

To reopen socket 2, enter again **#SSLSECDATA** command for www.site2.com

```
#SSLSECDATA=1,3,1,<len>
```

```
>...
```

Connect
#SSLD=2,443,"www.site2.com",...

3.19.14. AT#SSLSECCFG2 - Configure Additional Parameters of a SSL Socket

This command allows configuring additional SSL security parameters.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT#SSLSECCFG2=<SSId>,<version>,<SNI>[,<CustomCA>[,<PreloadedCA>[,<MinVersion>]]]**

Parameters:

| Name | Type | Default | Description |
|--------------------------------|---------|---------|--|
| <SSId> | integer | N/A | Secure Socket Identifier |
| Value: | | | |
| 1÷10 : SSL socket ID | | | |
| <version> | integer | 4 | select SSL/TLS protocol version |
| Values: | | | |
| 0÷2 : protocol version TLSv1.2 | | | |
| 3 : protocol version TLSv1.2 | | | |
| 4 : protocol version TLSv1.3 | | | |
| <SNI> | integer | 0 | enable/disable Service Name Indication |
| Values: | | | |
| 0 : SNI disabled | | | |
| 1 : SNI enabled | | | |
| <CustomCA> | integer | 1 | mask indicating which CA certificate is used from AT#SSLSECDATA |
| Values: | | | |

- 0 : No CA certificate
- 1 : Use the CA Certificate 1
- 2 : Use the CA Certificate 2
- 4 : Use the CA Certificate 3
- 8 : Use the CA Certificate 4

<PreloadedCA> integer 1 mask indicating which CA certificate is used from **AT#SSLSECCA**

Values:

- 0 : No CA certificate
- 1 : Use the CA Certificate 1
- 2 : Use the CA Certificate 2
- 4 : Use the CA Certificate 3

<MinVersion> integer 1 Set the Minimum acceptable TLS version

Values:

- 1 : protocol version TLSv1.0
- 2 : protocol version TLSv1.1
- 3 : protocol version TLSv1.2
- 4 : protocol version TLSv1.3

Additional info:

- ▶▶ Select which CA certificate to use
Maximum 3 certificate between **<PreloadedCA>** and **<CustomCA>** must be selected at the same time.

 **AT#SSLSECCFG2?**

Read command reports the currently selected parameters in the format:

```
#SSLSECCFG2: <SSId>,<version>,<SNI>,< CustomCA >,< PreloadedCA >
```

 **AT#SSLSECCFG2=?**

Test command reports the range of supported values for all the parameters.

See the following examples:

- Set 1st and 2nd certificates of **AT#SSLSECDATA** and 3rd certificate from **AT#SSLSECCA**

```
AT#SSLSECCFG =1,4,0,3,4
```

```
OK
```

- Set 2nd, 3rd and 4th certificates of **AT#SSLSECDATA** and NO certificate from **AT#SSLSECCA**

```
AT#SSLSECCFG =1,4,0,14,0
```

```
OK
```

3.20. CloT Optimization

3.20.1. AT+CCIOTOPT - CloT Optimization Configuration

This command controls CloT EPS (Cellular Internet of Things, Evolved Packet System) optimizations.

3GPP TS 27.007

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+CCIOTOPT=[<n>[,<supportedUEopt>[,<preferredUEopt>]]]

The set command controls which CloT EPS optimizations the UE indicates as supported and preferred in the ATTACH REQUEST and TRACKING AREA UPDATE REQUEST messages. The command also allows reporting of the CloT EPS optimizations that are supported by the network; an unsolicited result code is used to indicate the supported CloT EPS optimizations by the network:

+CCIOTOPTI: <supportedNetworkopt>

For parameter meaning refer to Unsolicited code values.

Parameters:

| Name | Type | Default | Description |
|------|---------|---------|---|
| <n> | integer | 0 | enables or disables reporting of unsolicited result code +CCIOTOPTI: |

Values:

0 : Disable reporting

1 : Enable reporting

- 3 : Disable reporting and reset the parameters for CloT EPS optimization to the default values

| | | | |
|-------------------------------|---------|---|--|
| <supportedUEopt> | integer | 3 | indicates the UE's support for CloT EPS optimizations. |
|-------------------------------|---------|---|--|

Values:

- 0 : No support
- 1 : Support for control plane CloT EPS optimization
- 2 : Support for user plane CloT EPS optimization
- 3 : Support for both control plane CloT EPS optimization and user plane CloT EPS optimization (default value for modules supporting NBloT technology)

| | | | |
|-------------------------------|---------|---|---|
| <preferredUEopt> | integer | 0 | indicates the UE's preference for CloT EPS optimizations. |
|-------------------------------|---------|---|---|

Values:

- 0 : No preference
- 1 : Preference for control plane CloT EPS optimization
- 2 : Preference for user plane CloT EPS optimization

Unsolicited field:

| Name | Type | Description |
|------------------------------------|---------|---|
| <supportedNetworkopt> | integer | indicates the Network support for CloT EPS optimizations. |

Values:

-
- 0 : No support.
 - 1 : Support for control plane CloT EPS optimization
 - 2 : Support for user plane CloT EPS optimization
 - 3 : Support for both control plane CloT EPS optimization and user plane CloT EPS optimization
-

AT+CCIOTOPT?

Read command returns the current parameter values in the format:

+CCIOTOPT :<n>,<supportedUEopt>,<preferredUEopt>

AT+CCIOTOPT=?

Test command reports the range for the parameters in the format:

+CCIOTOPT: (list of supported <n>s),(list of supported <supportedUEopt>s),(list of supported <preferredUEopt>s)

3.20.2. AT#CCIOTOPT - IoT Optimization Configuration

This command controls IoT EPS (Cellular Internet of Things, Evolved Packet System) optimizations.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#CCIOTOPT=<bitmask>

The set command controls which IoT EPS optimizations the UE indicates as supported and preferred in the ATTACH REQUEST and TRACKING AREA UPDATE REQUEST messages.

Parameter:

| Name | Type | Default | Description |
|-----------|------|---------|--|
| <bitmask> | hex | - | <p>is used to store the mask in NVM for subsequent use by protocol stack.</p> <p>The <bitmask> value - formed by four hex digit - is contained in two bytes.</p> <p>The first nine bits, starting from the right, are associated to the nine functions described in the table shown in Additional info.</p> <p>The default <bitmask> value is 0137</p> |

Additional info:

▶▶ Bitmap description of the <bitmask> parameter

| Last Significant Byte of <bitmask> | | |
|------------------------------------|-------------|---------------------------------|
| Bit 0 | EMM_CP_CIOT | Control Plane IoT optimizations |

| | | |
|------------------------------------|--------------------|--|
| Bit 1 | EMM_UP_CIoT | User Plane CloT optimizations |
| Bit 2 | EMM_S1_U | S1-U data transfer |
| Bit 3 | EMM_ER_WITHOUT_PDN | EMM registered w/o PDN connection |
| Bit 4 | EMM_HC_CP_CIoT | RoHC |
| Bit 5 | EMM_SMS_ONLY | |
| Bit 6 | EMM_PNB_CP_CIoT | Preferred network behavior CP CloT |
| Bit 7 | EMM_PNB_UP_CIoT | Preferred network behavior UP CloT |
| Most Significant Byte of <bitmask> | | |
| Bit 0 | EMM_EPCO_CIoT | Enable/disable extended protocol configuration options |
| Bit 1 ... Bit 7 | Not used | |

See the example.

AT#CCIOTOPT?

Read command returns the current bitmask value in the format:

#CCIOTOPT :<bitmask>

AT#CCIOTOPT=?

Test command reports the range for the parameter in the format:

#CCIOTOPT: (list of supported <bitmask> values)

Example of setting a value for **<bitmask>**.

- **AT#CCIOTOPT=0137**
OK

In this example, **<bitmask>**, expressed in four hex digit, is 0137=0000 0001 0011 0111

The mapping is:

| | | |
|---|--------------------|--|
| Last Significant Byte of <bitmask> | | |
| 1 | EMM_CP_CIoT | Control Plane CloT optimizations |
| 1 | EMM_UP_CIoT | User Plane CloT optimizations |
| 1 | EMM_S1_U | S1-U data transfer |
| 0 | EMM_ER_WITHOUT_PDN | EMM registered w/o PDN connection |
| 1 | EMM_HC_CP_CIoT | RoHC |
| 1 | EMM_SMS_ONLY | |
| 0 | EMM_PNB_CP_CIoT | Preferred network behavior CP CloT |
| 0 | EMM_PNB_UP_CIoT | Preferred network behavior UP CloT |
| Most Significant Byte of <bitmask> | | |
| 1 | EMM_EPCO_CIoT | Enable extended protocol configuration options |
| Bit 1 ... Bit 7 | Not used | |

3.21. IoT Portal

3.21.1. AT+ODIS - Command for Saving and Retrieving the Odis Parameters

This command allows the end-user to handle the Host Odis parameters. In case of AT&T LwM2M agent up and running, the command is executed internally to the LwM2M client, updating this client about the values change (i.e.: the server will be notified about this change if the observation on these items is active).

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT+ODIS=<odisInstance>,<hostUniqueDevId>,<hostManufacturer>,<hostModel>,<hostSwVersion>**

Parameters:

| Name | Type | Default | Description |
|---------------------------------|--------|---------|---|
| <odisInstance> | string | N/A | contains the Odis instance where the parameters will be stored |
| Values: | | | |
| 0 : Odis instance 0 | | | |
| 1 : Odis instance 1 | | | |
| <hostUniqueDevId> | string | HUID0 | contains a string, between double quotes, with the host unique device identifier. |
| Value: | | | |
| HUID0 : default value | | | |
| <hostManufacturer> | string | HMAN0 | contains a string, between double quotes, with the host manufacturer identifier. |
| Value: | | | |

HMAN0 : default value

| | | | |
|--------------------------|--------|-------|---|
| <hostModel> | string | HMOD0 | contains a string, between double quotes, with the host model identifier. |
|--------------------------|--------|-------|---|

Value:

HMOD0 : default value

| | | | |
|------------------------------|--------|------|--|
| <hostSwVersion> | string | HSW0 | contains a string, between double quotes, with the host software version identifier. |
|------------------------------|--------|------|--|

Value:

HSW0 : default value

- i The odis setting requires all the odis values to be set each time the command is issued, therefore, to change only one odis parameters it is recommended to read all the values first, and then compose the command input string accordingly.
- i Since the odis items are 4, it is quite unlikely but possible that some the storing of some of them fails. In this case, the new values, where succeeded, are kept. An advice is that, in case of storing failure, the **+ODIS?** command is used to verify what are the odis items changed, if any.
- i Starting from AT&T Specification Reference: 13340 v20.3, <CDR-DVM-1600>, the Odis Instance should be added as a first parameter to the +ODIS AT command. This will result in having a +ODIS command no longer compatible with previous command versions (i.e.: until specification Reference 13340 v20.2).

AT+ODIS?

Read command reports the current Odis values in the format:

```
+ODIS: 0,<hostManufacturer0>,<hostModel0>,<hostSwVersion0>
+ODIS: 1,<hostManufacturer1>,<hostModel1>,<hostSwVersion1>
```

- ❗ As per AT&T specification, the `<hostUniqueDevId> Odis` parameter could be set but it cannot be read by AT commands.

🔍 AT+ODIS=?

Test command reports the maximum length for all the parameters strings.

3.21.2. AT#FOTAURC - Sets FOTA Extended URCs

This command allows the end-user to enable/disable the FOTA extended URCs, resulting in a verbosity FOTA operations. Those settings are generally neither related nor manageable with other LwM2M agent commands.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#FOTAURC=<enable>

The settings are stored in the module and are not affected by module power-cycle, TFI or FOTA flashing.

Parameter:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|----------|---------|---|------------------------------|
| <enable> | integer | 0 | enable/disable extended URCs |
|----------|---------|---|------------------------------|

Values:

0 : disable extended URCs

1 : enable extended URCs

-  This command affects LwM2M, FA1 and OTAUP operations.
-  The command should add the following URCs:
 83. **#OTAEV: "FOTA REQUEST INIT"** at the FOTA startup beginning
 84. **#OTAEV: "DOWNLOAD STARTED"** at the delta package download beginning
 85. **#OTAEV: "DOWNLOAD COMPLETED"** at the delta package download end
 86. **#OTAEV: "DOWNLOAD FAILED"** at the delta package download failure
 87. **#OTAEV: "INTEGRITY CHECK PASS"** in case of valid delta package

88. **#OTAEV: "INTEGRITY CHECK FAIL"** in case of invalid delta package

- i** Please notice that following error URCs are issued always, regardless the **#FOTAURC** command setting:
#OTAEV: "DOWNLOAD FAILED"
#OTAEV: "INTEGRITY CHECK FAIL", <errorCode>
- i** Please notice that the time to issue the URCs is strictly related to the agent that is in charge of managing the FOTA operations and may strongly vary between them.
- i** Please notice that the **#OTAEV: "INTEGRITY CHECK FAIL"** URC may appear more than once, according to the retry policy of the delta validity check used by the FOTA entity, such as in LwM2M client.
- i** **<errorCode>** reported in **#OTAEV: "INTEGRITY CHECK FAIL"** URC may assume the following values:

 - 89. 10 in case of invalid delta file (i.e.: when the delta file has an invalid or corrupted tag)
 - 90. 21 in case of CRC calculated error (i.e.: when the delta file is not applicable to the current software version)

AT#FOTAURC?

Returns the **<enable>** value

AT#FOTAURC=?

Test command reports the supported range of values.

**#FOTAURC** command examples:

- LwM2M:
After writing resource /5/0/1 with a proper URI with a valid delta package link:
#OTAEV: "FOTA REQUEST INIT"
#OTAEV: "DOWNLOAD STARTED"
#OTAEV: "DOWNLOAD COMPLETED"
#OTAEV: "INTEGRITY CHECK PASS"
#LWM2MINFO: "GEN","FOTA REBOOT"
#OTAEV: Module Upgraded To New Fw

After writing resource /5/0/1 with a proper URI with an invalid delta package link:

#OTAEV: "FOTA REQUEST INIT"
#OTAEV: "DOWNLOAD STARTED"
#OTAEV: "DOWNLOAD COMPLETED"
#OTAEV: "INTEGRITY CHECK FAIL"

After writing resource /5/0/1 with a proper URI, with a download failure:

#OTAEV: "FOTA REQUEST INIT"
#OTAEV: "DOWNLOAD STARTED"
#OTAEV: "DOWNLOAD FAILED"

- FA1:
After sending an FA1 message with a valid delta package link:
#OTAEV: "FOTA REQUEST INIT"
#OTAEV: "DOWNLOAD STARTED"
#OTAEV: "DOWNLOAD COMPLETED"
#OTAEV: "INTEGRITY CHECK PASS"
#OTAEV: "FOTA REBOOT"
#OTAEV: Module Upgraded To New Fw
- OTAUP:
Using a formerly loaded valid package:
AT#OTAUP=0,3
...

OTAEV: "INTEGRITY CHECK PASS"

...

#OTAEV: Module Upgraded To New Fw

Using a formerly loaded invalid package:

AT#OTAUP=0,3

...

OTAEV: "INTEGRITY CHECK FAIL"

3.22. FOTA & OMA

3.22.1. FOTA Legacy

3.22.1.1. AT#OTAUPW - OTA Delta Write

Execution command starts injection of a delta file into the device.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#OTAUPW=<size>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------------------|
| <size> | integer | - | size in bytes of data to be injected |

AT#OTAUPW=?

Test command returns **OK** result code.

3.22.2. OMA-DM

3.22.2.1. AT#HOSTODIS - Host ODIS Parameters Management

The command manages the Host Odis parameters related to AT&T OMA-DM Client.

[1] <CDR-DVM-4532> of AT&T, revision 16.3

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#HOSTODIS=<Param>,<Action>[,<Value>[,<Instance>]]

The set command allows the end-user to handle the Host Odis parameters for AT&T OMADM client

Parameters:

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

<Param> integer N/A selects the specific item on which work.

Values:

0 : Host Manufacturer name

1 : Host model Name

2 : Host Software application version

3 : Host Device Unique ID

<Action> integer N/A selects the action to be performed on the item selected by <Param>

Values:

0 : "SET" action

1 : "GET" action

2 : "RESET" action

| | | | |
|----------------------|--------|---|---|
| <Value> | string | - | contains a string, between double quotes, with data to be set. Maximum string length is 64 characters. It is valid only if <Action> = 0 ("SET" action) |
|----------------------|--------|---|---|

| | | | |
|-------------------------|---------|---|-----------------|
| <Instance> | integer | 0 | instance number |
|-------------------------|---------|---|-----------------|

Value:

0,1 : allowed values

- i** Host Manufacturer, Host Model and Host Software application version do not change after an OTA firmware upgrade
- i** "GET" action is not allowed on Host Device Unique ID.
- i** Default values, according to specification [1], are:
 91. HMAN1 (for Host Manufacturer)
 92. HMOD1 (for Host Model)
 93. HSW1 (for Host Software version)
 94. HUID1 (for Host Device Unique ID)

AT#HOSTODIS=?

Test command returns the supported values ranges of the parameters.

Get the currently set values (i.e.: Host Model)

```
AT#HOSTODIS=1,1
#HOSTODIS:"HMOD1"
OK
```

Set a new Host Model value

```
AT#HOSTODIS=1,0,"Model #4 - 2nd version"
OK
```

Get the currently set value

```
AT#HOSTODIS=1,1
#HOSTODIS: 0,"Model #4 - 2nd version"
OK
```

Reset the Model value

```
AT#HOSTODIS=1,2
OK
```

Get again the currently set value

```
AT#HOSTODIS=1,1
#HOSTODIS:"HMOD1"
OK
```

3.23. M2M

3.23.1. AT#M2MCHDIR - M2M File System Change Current Directory

This command manages the M2M File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MCHDIR=<path>

Set command sets the current working directory in the M2M file system.

Parameter:

| Name | Type | Default | Description |
|--------|--------|---------|---|
| <path> | string | - | can be: <ul style="list-style-type: none"> 95. full directory path name starting with "/" 96. relative directory path name 97. directory name (in current directory) |

- i** Maximum full directory length is 128 chars, maximum folder name is 64 chars.
- i** If <path> is not present an error code is reported.
- i** <path> is case sensitive.
- i** <path> can be equivalently enclosed on quote or not.
- i** Path separator must be "/".
- i** The current directory in M2M file system at every power on is "/mod".

AT#M2MCHDIR?

Read command reports the current working directory in the M2M file system in the format:

#M2MCHDIR: "<path>"

Additional info:

- ▶▶ Parameter description is:

| Name | Type | Default | Description |
|--------|--------|---------|--|
| <path> | string | - | Absolute path name, quoted string type (max 128 chars, case sensitive) |

AT#M2MCHDIR=?

Test command returns **OK** result code.

Check directory and move to dir1 directory.

- AT#M2MCHDIR?
#M2MCHDIR: "/mod"
OK
AT#M2MCHDIR="dir1"
OK
AT#M2MCHDIR?
#M2MCHDIR: "/mod/dir1"
OK

3.23.2. AT#M2MMKDIR - M2M File System Make Directory

This command manages the M2M File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MMKDIR=<directory_name>

Set command makes a new directory in current directory (see **#M2MCHDIR**) or on a specified path. The new directory must be created on existing path, only one directory at time can be created.

Parameter:

| Name | Type | Default | Description |
|------------------|--------|---------|--|
| <directory_name> | string | - | can be: <ol style="list-style-type: none"> 98. full directory path name starting with "/" (parent directory must exist) 99. relative directory path name (parent directory must exist) 100. directory name (in current directory) |

-  Maximum full directory length is 128 chars, maximum folder name is 64 chars.
-  <directory_name> is case sensitive.
-  <directory_name> can be equivalently enclosed on quote or not.

AT#M2MMKDIR=?

Test command returns **OK** result code

```
AT#M2MMKDIR="dir1"  
OK  
AT#M2MMKDIR="/myfolder"  
OK  
AT#M2MMKDIR="/myfolder/mySubfolder"  
OK  
AT#M2MCHDIR="/myfolder/mySubfolder"  
OK  
AT#M2MMKDIR=newFolder  
OK  
AT#M2MCHDIR="/myfolder/mySubfolder/newFolder"  
OK
```

3.23.3. AT#M2MBACKUP - M2M Set Backup Feature

This command manages the M2M File System and backup partition.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#M2MBACKUP=<enable>

Set command sets/resets the backup status of the executable binary file. Only the first starting file will be saved in backup partition.

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|---------------------------------|
| <enable> | integer | 0 | set/reset the BACKUP permission |

Values:

- 0 : resets BACKUP status and backup partition
- 1 : sets BACKUP status and backup will be performed after reboot

AT#M2MBACKUP?

Read command reports the BACKUP status. The report has the following format:

#M2MBACKUP: <enable>

AT#M2MBACKUP=?

Test command returns the allowed values for parameter <enable>.

Set BACKUP status
AT#M2MBACKUP=1
OK

Check what is the BACKUP status value.
AT# M2MBACKUP?
M2MBACKUP: 1
OK

3.23.4. AT#M2MRMDIR - M2M File System Remove Directory

This command removes a directory in the M2M file system.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MRMDIR=<directory_name>

Set command deletes a specified directory in current directory (see #M2MCHDIR) or a directory in a specified path.

Parameter:

| Name | Type | Default | Description |
|------------------|--------|---------|--|
| <directory_name> | string | - | can be: <ol style="list-style-type: none"> 101. full directory path name starting with "/" 102. relative directory path name 103. directory name (in current directory) |

-  Maximum full directory length is 128 chars, maximum folder name is 64 chars
-  If <directory_name> is not present an error code is reported
-  <directory_name> is case sensitive
-  <directory_name> can be equivalently enclosed on quote or not
-  To be removed, the <directory_name> must be empty otherwise an error is returned.

AT#M2MRMDIR=?

Test command returns OK result code.

```
AT#M2MRMDIR=dir1
OK
AT#M2MRMDIR="/myfolder/dir2"
OK
AT#M2MCHDIR="/myfolder"
OK
AT#M2MRMDIR="mySubfolder/dir3"
OK
```

3.23.5. AT+M2M - Enable/disable M2M Application execution

This command enable/disable the M2M Application execution start mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT+M2M=<mode>[,<delay>]

Set command sets the M2M Application start mode. After issuing the AT command, the module automatically restart.

Parameters:

| Name | Type | Default | Description |
|---------------------|---------|---------|--------------------------------------|
| <mode> | integer | 1 | M2M application execution start mode |

Values:

- 0 : AppZone engine does not start at the next reboot
- 1 : AppZone engine starts at the next reboot without delay. Only apps with AT#M2MRUN=1 will start after reboot, with their specific delay setting.
- 4 : AppZone engine starts at the next reboot using the delay set by <delay> parameter, if missing is used the default value 10.

| | | | |
|----------------------|---------|---|---|
| <delay> | integer | 0 | M2M application execution start time-out expressed in seconds. Parameter <delay> is used only if parameter <mode> is set to 4. |
|----------------------|---------|---|---|

Values:

- 0 : no delay for AppZone engine to start
- 10÷60 : delay for AppZone engine to start. During this waiting time an AT command on the serial/USB

port can disable the AppZone engine, and it will not start until the next reboot.

AT+M2M?

Read command reports the M2M application execution start mode, start time-out and start shell in the format:

+M2M:<mode>,<delay>

AT+M2M=?

Test command returns the range of available values for parameters **<mode>** and **<delay>**.

3.23.6. AT#M2MRUN - M2M Set Run File Permission

Set command sets/resets the RUN file permission and the delay start of the executable binary files with ".bin" extension, stored in the directory /mod. Please see note for the executable binary definition. It supports the multi-app feature.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

 **AT#M2MRUN=<mode>[, [<file_bin>], [<delay>]]**

Parameters:

| Name | Type | Default | Description |
|-------------------------|---------|--|--|
| <mode> | integer | N/A | set/reset the RUN file permission |
| Values: | | | |
| 0÷2 | : | Boot mode: it takes effect after next reboot, see Additional info section, see Additional info section | |
| 3÷5 | : | Immediate mode: it immediately takes effect (start\stop), see Additional info section | |
| <file_bin> | string | - | *.bin file for which you RUN permission has to be set, its format is a quoted or unquoted string (max 64 chars, case sensitive). File name extension must be .bin. If parameter <file_bin> is not present, the setting is applied to all executable files. |
| <delay> | integer | 0 | is the <file_bin> delay parameter if the <file_bin> is present, otherwise it effects all the executables present in the /mod directory. Delay is relative to AppZone engine start which is in turn delayed by +M2M command setting. |

Depending on selected **<mode>** two different delays have effects, see Additional info section

Value:

0÷60 : range of the delay expressed in seconds

Additional info:

- ▶▶ The boot modes **<mode>=0**, **<mode>=1** and **<mode>=2** have effect after next reboot.

104. **AT#M2MRUN=0**

NO RUN permission for all executables *.bin files in "/mod ", the command does not set all binary file as executable

105. **AT#M2MRUN=1**

RUN permission for all executables *.bin files in "/mod ", the command does not set all binary file as executable

106. **AT#M2MRUN=2,"app2.bin"**

Exclusive RUN permission: if file exist, set "/mod/app2.bin" as executable and provides RUN permission only for it. Current delay not changed or set to default 0 if not still an executable.

107. **AT#M2MRUN=1,,10**

RUN permission with delay =10 sec for all executable *.bin

108. **AT#M2MRUN=1,"app2.bin"**

RUN permission: if it exists, set "/mod/app2.bin" as executable, current delay not changed or set to default 0 if not still an executable

109. **AT#M2MRUN=1,"app3.bin",0**

RUN permission: if it exists, set "/mod/app3.bin" as executable and delay set to 0

110. **AT#M2MRUN=0,"app2.bin",0**
NO RUN permission: if it exists, set "/mod/app2.bin" as executable, delay set to 0. The RUN permission of all other *.bin files are not changed

- ▶ The immediate modes **<mode>=3**, **<mode>=4** and **<mode>=5** have immediate effect. "in place" used hereafter means without reboot needed;

<mode>=3 does not require any executable is running, having in mind the aim of the command.

After exclusive load (**<mode>= 5**) the other executables than the selected one, are immediately stopped with 0 delay, but their own previous immediate delays are preserved.

111. **AT#M2MRUN=3**
in place stop of all apps in running with their last set immediate delay.
In case of error the command will try in any case to stop as many executables as possible

112. **AT#M2MRUN=3,,20**
in place stop of all apps after 20 seconds of delay

113. **AT#M2MRUN=3,"app2.bin"**
in place stop of app2.bin, after its own last volatile delay

114. **AT#M2MRUN=3,"app2.bin",0**
immediate stop of app2.bin

115. **AT#M2MRUN=3,"app2.bin",10**
in place stop of app2.bin after 10 seconds

116. **AT#M2MRUN=4** in place start of all apps if not already in running. The current immediate delays are used. In case of

error, will try to start in any case as many executables as possible

117. **AT#M2MRUN=4,,20** in place start of all apps if not already in running after 20 seconds for all
118. **AT#M2MRUN=4,"app2.bin"** in place start of app2.bin if not already in running with the current immediate delay
119. **AT#M2MRUN=4,"app2.bin",10** in place start of app2.bin if not already in running after 10 seconds
120. **AT#M2MRUN=5,"app2.bin"**
immediate stop of all apps in running, and in place start of app2.bin, if not already in running, after its own current immediate delay
121. **AT#M2MRUN=5,"app2.bin",0**
immediate stop of all apps in running, and immediate start of app2.bin with no delay, if not already in running
122. **AT#M2MRUN=5,"app2.bin",10** immediate stop of all apps in running, and in place load of app2.bin, if not already in running, after 10 sec. delay

►► Depending on selected **<mode>** two different delays have effects.

1. Boot mode: in this mode both "boot" and "immediate" delays are affected:
if **<delay>** not provided:
delays are not changed from their previous configured values. Default values are 0.
if **<delay>** provided:
delays are set accordingly
2. Immediate mode: in this mode only "immediate" delay is set:
if **<delay>** not provided:

"immediate" delay is not changed from its previous configured value.
 if **<delay>** provided:
 "Immediate" delay is set accordingly.

See special case for **<mode>=5** in additional info.

- i** Parameters setting provided with **<mode>** in boot mode range is saved on `"/mod/appcfg.ini"` file
- i** Executables are binary files with `".bin"` extension saved in `"/mod"` directory which RUN permission has been set individually by **#M2MRUN** command (boot mode) including specific `*.bin` file. The integrity check is performed internally.
- i** In order to allow any application to start, the AppZone engine must be running (see **+M2M**).

AT#M2MRUN?

Read command reports the executables properties. The report has the following format

```
#M2MRUN: <app1.bin,run1,delay1,state1,va1,ram1>
#M2MRUN: <app2.bin,run2,delay2,state2,va2,ram2>
...
#M2MRUN: <appN.bin,runN,delayN,stateN,vaN,ramN>
```

Additional info:

- ▶▶ Here are the parameters meanings.

| Name | Type | Default | Description |
|-------------------------|--------|---------|-----------------|
| <appN.bin> | string | - | executable name |

| | | | |
|--|---------|-----|---|
| <runN> | integer | N/A | executable run boot property |
| Values: | | | |
| 0 : do not start after reboot | | | |
| 1 : auto start after reboot | | | |
| <delayN> | integer | - | executable boot delay |
| <stateN> | integer | N/A | executable run state |
| Values: | | | |
| 0 : ready | | | |
| 1 : starting (not yet in running) | | | |
| 2 : running | | | |
| 3 : stopping (still in running) | | | |
| 4 : stopped (has been stopped, can be restarted) | | | |
| <vaN> | hex | - | load virtual address of executable |
| <ramN> | integer | - | ram usage of executable if running, or estimated ram needed, 20KB bounded, if not running |

- i** **AT#M2MRUN?** will reflect executable removal from file system:
3. Immediately if not in running
 4. After stop of the executable if in running

? **AT#M2MRUN=?**

Test command returns the values range of the **<mode>** parameter, the maximum number of characters of the **<file_bin>** parameter and the values range for the **<delay>** parameter. The format is:

#M2MRUN: (0-5),64,(0-60)

3.23.7. AT#M2MDEL - M2M Delete File

This command deletes specified file stored in the File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MDEL=<file_name>

Set command removes the <file_name> in the file system.

Parameter:

| Name | Type | Default | Description |
|-------------|--------|---------|---|
| <file_name> | string | - | can be: <ol style="list-style-type: none"> 5. full file path name starting with "/" 6. relative file path name 7. file name (in current directory) |

-  Maximum full path length is 128 chars, maximum folder or file name is 64 chars. Overall max full file path is 128 + 64 = 192 chars.
-  If the file <file_name> or its path is not present an error code is reported.
-  <file_name> and its path are case sensitive.
-  <file_name> can be equivalently enclosed on quote or not.

AT#M2MDEL=?

Test command returns **OK** result code.

Remove M2MAPZ.bin file in "/mod" folder

```
AT#M2MDEL="/mod/M2MAPZ.bin"
```

OK

```
AT#M2MCHDIR=/myFolder
```

OK

```
AT#M2MDEL=mySubfolder/myFile.txt
```

OK

3.23.8. AT#M2MWRITE - M2M Write a File

This command stores a file in the file system.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MWRITE=<file_name>,<size>[,<binToMod>]

Execution command stores a generic file in the folder specified by <file_name> parameter. The file should be sent using RAW ASCII file transfer, and hardware flow control should be used. After command line is terminated with <CR>, the module prompts the following five-character sequence:

<CR>,<LF>,<greater_than><greater_than><greater_than> (see IRA 13, 10, 62, 62, 62)

then a file sized <size> bytes can be sent from TE.

The operations complete when all bytes are received. If writing ends successfully the response is **OK**, otherwise, an error code is reported.

Parameters:

| Name | Type | Default | Description |
|-------------|---------|---------|--|
| <file_name> | string | - | can be: <ol style="list-style-type: none"> 8. full file name path starting with "/" 9. relative file name path 10. file name (in current directory) |
| <size> | integer | - | file size |
| <binToMod> | integer | - | if <file_name> is provided as filename with ".bin" extension, using <binToMod> set to 1, force the file to be automatically written on "/mod" folder whichever is the current directory. |

- i** Maximum full path length is 128 chars, maximum folder or file name is 64 chars. Overall max full file path is 128 + 64 = 192 chars.
- i** If the file <file_name> or its path is not present an error code is reported.
- i** <file_name> can be equivalently enclosed on quote or not.
- i** <file_name> and its path are case sensitive.

AT#M2MWRITE=?

Test commands returns **OK** result code.

Store "M2MAPZ.bin" file in "/mod" folder.

```
AT#M2MWRITE="/mod/M2MAPZ.bin",58044
```

```
>>> here receives the prompt; then type or send the file, sized 58044 bytes  
OK
```

```
AT#M2MCHDIR=/myFolder
```

```
OK
```

Store "Readme.txt" file in "/myFolder" folder.

```
AT#M2MWRITE=Readme.txt,2128
```

```
>>> here receives the prompt; then type or send the file, sized 2128 bytes  
OK
```

Store "APP.bin" file directly in "/mod" folder using <binToMod> option.

```
AT#M2MWRITE="APP.bin",32562,1
```

```
>>> here receives the prompt; then type or send the file, sized 32562 bytes  
OK
```

3.23.9. AT#M2MLIST - M2M File System List

This command lists the contents of a folder in the File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MLIST[=<path>]

Execution command reports the list of directories and files stored in current directory of the file system (see **#M2MCHDIR** for current path) or in path specified by **<path>**. The report is shown in Additional info section.

Parameter:

| Name | Type | Default | Description |
|---------------------|--------|---------|---|
| <path> | string | - | can be: <ol style="list-style-type: none"> 11. full directory path if starting with "/" 12. relative directory path name 13. directory name (in current directory) |

Additional info:

- ▶▶ Here is the report format:

```
[<CR><LF>#M2MLIST: <.>
<CR><LF>#M2MLIST: <..>]
[<CR><LF>#M2MLIST: <<dir_name_1>>...
<CR><LF>#M2MLIST: <<dir_name_n>>]
[<CR><LF>#M2MLIST: "<file_name_1>",<size_1>...
<CR><LF>#M2MLIST: "<file_name_n>",<size_n>]
```

| Name | Type | Default | Description |
|-------------------------|--------|---------|---|
| <.> | string | - | current directory |
| <..> | string | - | upper directory |
| <dir_name> | string | - | directory name, string type delimited by characters '<' and '>' |

| | | | |
|-------------|--------|---|---|
| | | | (max 64 characters, case sensitive). |
| <file_name> | string | - | file name, quoted sting type (max 64 characters, case sensitive). |
| <size> | string | - | size of file in bytes |

- i** Maximum full directory length is 128 chars, maximum folder name is 64 chars.
- i** If <path> is not present an error code is reported.
- i** <path> is case sensitive.
- i** <path> can be equivalently enclosed on quote or not.
- i** Path separator must be "/".
- i** The current directory in M2M file system at every power on is "/mod".

AT#M2MLIST=?

Test command returns **OK** result code.

```
AT#M2MLIST
#M2MLIST: <.>
#M2MLIST: <..>
#M2MLIST: <dir1>
#M2MLIST: "file_load.bin",58044
```

```
AT#M2MLIST=/mypath/myfolder
#M2MLIST: <.>
#M2MLIST: <..>
#M2MLIST: <mysubfolder>
#M2MLIST: "myfile.txt",512
#M2MLIST: "readm.txt",140
```

```
AT#M2MCHDIR=/mypath
OK
```

```
AT#M2MLIST=myfolder
#M2MLIST: <.>
#M2MLIST: <..>
#M2MLIST: <mysubfolder>
#M2MLIST: "myfile.txt",512
#M2MLIST: "readm.txt",140
```

3.23.10. AT#M2MREAD - M2M Read File

This command reports the content of a file stored in the File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MREAD=<file_name>

Execution command reads the content of a generic file stored in the folder specified by <file_name> parameter. After command line is terminated with <CR>, the module prompts the following five-character sequence:

<CR><LF><less_than><less_than><less_than> (see IRA 13, 10, 60, 60, 60)

followed by the file content.

Parameter:

| Name | Type | Default | Description |
|-------------|--------|---------|--|
| <file_name> | string | - | can be: <ol style="list-style-type: none"> 14. full file name path starting with "/" 15. relative file name path 16. file name (in current directory) |

-  Maximum full path length is 128 chars, maximum folder or file name is 64 chars. Overall max full file path is 128 + 64 = 192 chars.
-  If the file <file_name> or its path is not present in the file system, an error code is reported.
-  <file_name> and its path are case sensitive
-  <file_name> can be equivalently enclosed on quote or not

 **AT#M2MREAD=?**

Test command returns **OK** result code.

```
AT#M2MREAD="/xxfolder/config/config.txt"
```

<<< here receive the prompt; then the file is displayed, immediately after the prompt

```
OK
```

```
AT#M2MCHDIR="/xxfolder"
```

```
OK
```

```
AT#M2MREAD=config/config.txt
```

<<< here receive the prompt; then the file is displayed, immediately after the prompt

```
OK
```

3.23.11. AT#M2MREADEXT - M2M Read File Extended

This command reports the content of a file stored in the File System.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MREADEXT=<file_name>[,<maxByte>[,<viewMode>[,<chunkPrint>]]]

Execution command reads the content of a generic file stored in the folder specified by <file_name> parameter. After command line is terminated with <CR>, the module prompts the following five-character sequence:

<CR><LF><less_than><less_than><less_than> (see IRA 13, 10, 60, 60, 60)

followed by the file content.

Parameters:

| Name | Type | Default | Description |
|--------------|---------|---------|--|
| <file_name> | string | - | can be: <ol style="list-style-type: none"> 17. full file name path starting with "/" 18. relative file name path 19. file name (in current directory) |
| <maxByte> | integer | 0 | maximum number of bytes to read Value: 0÷4096 : maximum number of bytes to read |
| <viewMode> | integer | 0 | enable/disable verbose mode Values: 0 : text format 1 : hexadecimal format |
| <chunkPrint> | integer | 0 | chunk print mode |

Values:

- 0 : print whole file content at once or one <maxByte> and exit
- 1 : print one < maxByte > and wait for <CR> char to continue

-
- i** <maxByte>=0 and <chunkPrint>=1 combination is not allowed.
 - i** Maximum full path length is 128 chars, maximum folder or file name is 64 chars. Overall max full file path is 128 + 64 = 192 chars.
 - i** If the file <file_name> or its path is not present in the file system, an error code is reported.
 - i** <file_name> and its path are case sensitive.
 - i** <file_name> can be equivalently enclosed on quote or not.
 - i** When printing the file content in <maxByte> chunks, omit the <file_name> on all subsequent AT command executions. Check code examples for further details.

?  AT#M2MREADEXT=?

Test command returns **OK** result code.

AT#M2MREADEXT="/xxfolder/config/config.txt"

<<< here receives the prompt and then the file content is displayed immediately after the prompt

OK

AT#M2MCHDIR="/xxfolder"

OK

AT#M2MREADEXT=config/config.txt

<<< here receives the prompt and then the file content is displayed immediately after the prompt

OK

Single chunk print mode:

AT#M2MREADEXT=config/config.txt,1000

<<< here receives the prompt; then the first 1000 bytes after the prompt

OK

AT#M2MREADEXT=,1000

<<< here receives the prompt and the subsequent 1000 bytes after the prompt.

OK

AT#M2MREADEXT=,1000 continue until the end of the file

<<< here receives the prompt and the subsequent 1000 bytes after the prompt.

OK

Continuous chunk print mode:

AT#M2MREADEXT=config/config.txt,1000,0,1

<<<

here receives the prompt (only once) and the subsequent 1000 bytes after the prompt. The <CR> char triggers the next print of 1000 bytes.

The **OK** is printed once the whole file content has been printed.

OK

3.23.12. AT#M2MRAM - AppZone RAM Info

The execution command returns information on RAM memory for AppZone applications.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#M2MRAM

The execution command response is in the format:

#M2MRAM: <totRam>,<availRam>

Additional info:

- ▶▶ Here are the parameters meanings.

| Name | Type | Default | Description |
|------------|---------|---------|---|
| <totRam> | integer | - | total RAM for AppZone application space in bytes |
| <availRam> | integer | - | current available RAM for AppZone applications in bytes |

AT#M2MRAM=?

Test command returns the **OK** result code.

Get information about AppZone applications RAM memory.

AT#M2MRAM

#M2MRAM: 2064376,1503216

OK

3.23.13. AT#M2MARG - M2M Set Arguments

Set command sets/resets the main arguments of the executable binary file (".bin" extension) saved in "/mod" directory which RUN permission has been set by #M2MRUN command. The arguments are used by M2MB_main(argc, argv) function.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

 **AT#M2MARG=[<file_bin>],[<arg1>,<arg2>,....,<argn>,....,<argN>]**

Parameters:

| Name | Type | Default | Description |
|------------|--------|---------|--|
| <file_bin> | string | - | executable file name selected for arguments setting/resetting. If parameter <file_bin> is not present, the arguments configuration is applied to all executables. The format of <file_bin> is a quoted or unquoted string, max 64 chars, case sensitive. |
| <argn> | mixed | - | arguments to be applied. Format is unquoted string (max 32 chars, case sensitive) and maximum number of arguments is N=10. The empty space is seen as normal character. Comma is not supported as char inside arguments. If none of <argn> is present, arguments are deleted (reset). If an empty arg is provided in between other args, an ERROR is returned being the current args remained unchanged. See the following examples: 20. AT#M2MARG=app.bin,arg1,arg2,....,argN set the arguments to "/mod/app.bin" if it exists |

21. **AT#M2MARG=,arg,arg2,...,argN**
set the arguments to all executables
22. **AT#M2MARG=app.bin,**
delete the arguments of "/mod/app.bin"
if it exists
23. **AT#M2MARG=,**
delete the arguments of all executable
24. **AT#M2MARG=app.bin,arg1,,arg3**
if an empty arg is provided in between
other args, an ERROR is returned being
the current args remained unchanged

 The arguments entered by the command are saved on
"/mod/appcfg.ini" file.

AT#M2MARG?

Read command reports the available executables and their current arguments. The report has the following format:

```
#M2MARG: <app1.bin,arg1,arg2,...,argN1>  
#M2MARG: <app2.bin,arg1,arg2,...,argN2>  
...  
#M2MARG: <appQ.bin,arg1,arg2,...,argNQ>
```

AT#M2MARG=?

Test command returns the max characters number of <file_bin> binary file name and of the <argn> parameters. The format is:

```
#M2MARG: 64,32,...,32
```

```
AT#M2MARG=app1.bin,one,two,12,34.5  
OK
```

```
AT#M2MARG=app2.bin,first,"second and third"  
OK
```

```
AT#M2MARG=?  
#M2MARG: <app1.bin, one,two,12,34.5>  
#M2MARG: <app2.bin, first,"second and third">  
OK
```

3.24. MQTT

3.24.1. AT#MQEN - Enable MQTT Feature

This command initializes a MQTT client and allocates the necessary resources.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQEN=<instanceNumber>,<enable>

Set command enables/disables the MQTT client for further configuration and usage.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | selects the client instance to activate or deactivate |

Value:

1÷maxClients : client instance range. To know maxClients value use test command

| | | | |
|----------|---------|-----|--|
| <enable> | integer | N/A | selects if client must be activated or deactivated |
|----------|---------|-----|--|

Values:

0 : disable

1 : enable

AT#MQEN?

Read command returns the status of the MQTT stack in the format

#MQEN: <instanceNumber>,<enabled>

 **AT#MQEN=?**

Test command reports the available range of values for parameters.

Read command

```
AT#MQEN?
```

```
#MQEN: 1,1
```

```
#MQEN: 2,0
```

```
OK
```

Test command

```
AT#MQEN=?
```

```
#MQEN: (1-maxClients),(0-1)
```

```
OK
```

3.24.2. AT#MQCFG - Configure MQTT Parameters

This sets the connection parameters for the selected MQTT client.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQCFG=<instanceNumber>,<hostname>,<port>,<cid>[,<sslEn>]**

Parameters:

| Name | Type | Default | Description |
|------------------|---------|--------------|--|
| <instanceNumber> | integer | N/A | selects the client instance. The list of available clients is obtained with AT#MQEN? or the read command |
| | | Value: | |
| | | 1÷maxClients | : client instance range. To know maxClients value use test command |
| <hostname> | string | - | URL of the MQTT broker. Default value: 0. Maximum length of <hostname> is 512 characters. |
| <port> | integer | 0 | TCP port of the MQTT broker |
| | | Value: | |
| | | 1÷65535 | : TCP port range |
| <cid> | integer | N/A | PDP Context ID to be used for the connection. PDP context should be enabled before giving this command. Default value 0. |
| | | Value: | |

1÷6 : <cid> range

| | | | |
|---------|---------|---|--------------------|
| <sslEn> | integer | 0 | enable/disable SSL |
|---------|---------|---|--------------------|

Values:

0 : disable

1 : enable

AT#MQCFG?

Read command returns the configuration of all active MQTT clients in the format:

#MQCFG: <instanceNumber>,<hostname>,<port>,<cid>[,<sslEn>]

AT#MQCFG=?

Test command reports the available range of values for parameters.

- SSL disabled (by default)
`AT#MQCFG=1,api.mybroker.com,1883,3`
OK

Read command

```
AT#MQCFG?  
#MQCFG: 1,api.mybroker.com,1883,3,0  
#MQCFG: 2,,1883,1  
OK
```

Test command

```
AT#MQCFG=?  
#MQCFG: (1-maxClients),512,(1-65535),(1-6),(0-1)  
OK
```

- SSL enabled
`AT#MQCFG=1,api.mybroker.com,8883,3,1`
OK

Read command

```
AT#MQCFG?  
#MQCFG: 1,api.mybroker.com,8883,3,1  
#MQCFG: 2,,1883,1,0  
OK
```

Test command

```
AT#MQCFG=?  
#MQCFG: (1-maxClients),512,(1-65535),(1-6),(0-1)  
OK
```

3.24.3. AT#MQDISC - Log Out and Disconnect from the MQTT Broker

This command performs the logout and disconnection from to the MQTT broker.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQDISC=<instanceNumber>

Disconnects gracefully from the MQTT broker, then closes the network connection

Parameter:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | selects the client instance to activate or deactivate |

Value:

1÷maxClients : client instance range. To know maxClients value use test command

AT#MQDISC=?

Test command reports the available range of values for parameters.

 AT#MQDISC=1
OK

Test command
AT#MQDISC=?
#MQDISC: (1-maxClients)
OK

3.24.4. AT#MQCONN - Connect and Log in the MQTT Broker

This command performs the connection and login to the MQTT broker.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQCONN=<instanceNumber>,<clientID>,<userName>,<passWord>**

Set command performs network connection (using parameters set with **#MQCFG**) and sends the CONNECT packet to the MQTT broker.

Parameters:

| Name | Type | Default | Description |
|-------------------------------|--------------|---------|--|
| <instanceNumber> | integer | N/A | selects the client instance. The list of available clients is obtained with AT#MQEN? or the read command. |
| Value: | | | |
| | 1÷maxClients | : | client instance range. To know maxClients value use test command |
| <clientID> | string | - | identifies each MQTT client that connects to the MQTT broker. Maximum length of <clientID> is 23. |
| <userName> | string | - | authentication and authorization. Maximum length of <userName> is 512. |
| <passWord> | string | - | authentication and authorization. Maximum length of <passWord> is 512. |

- i** If connection status is other than init state or connected, disconnect using **#MQDISC** before reconnecting using **#MQCONN**.

AT#MQCONN?

Read command reports the configuration of active MQTT connections in the format:

#MQCONN=<instanceNumber>,<state>

Additional info:

- ▶▶ The following tables shows the **<state>** values and meanings:

| Client status: <state> | Normal/ Failure Events Values |
|------------------------|--|
| 0 | client is initialized but not connected |
| 1 | client performed MQTT authentication with broker |
| 2 | connection closed or reset by the server |
| 3 | the answer to the ping request packet was not received |
| 4 | the CONNACK packet was not received |
| 5 | the CONNECT packet was not delivered |
| 6 | failure in the m2mb APIs |
| 7 | socket timeout or read error |

AT#MQCONN=?

Test command reports the available range of values for parameters.

```
AT#MQCONN=1,myClientID,myUser,myPassword  
OK
```

Scenario (1)

Read command

```
AT#MQCONN?
```

```
#MQCONN: 1,1
```

```
#MQCONN: 2,0
```

```
OK
```

Test command

```
AT#MQCONN=?
```

```
#MQCONN: (1-maxClient),23,512,512
```

```
OK
```

Scenario (2)

Read command

```
AT#MQCONN?
```

```
#MQCONN: 1,2
```

```
OK
```

Set command

```
AT#MQDISC=1
```

```
OK
```

Read command

```
AT#MQCONN?
```

```
#MQCONN: 1,0
```

```
OK
```

3.24.5. AT#MQCFG2 - Configure Additional MQTT Parameters

This command sets the optional connection parameters for the selected MQTT client.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQCFG2=<instanceNumber>,<keepAlive>,<cleanSession>**

Parameters:

| Name | Type | Default | Description |
|------------------|---------|--------------|--|
| <instanceNumber> | integer | N/A | selects the client instance. The list of available clients is obtained with AT#MQEN? or the read command. |
| | | Value: | |
| | | 1÷maxClients | : client instance range. To know maxClients value use test command |
| <keepAlive> | integer | 20 | timeout of periodic packet to keep connection open |
| | | Value: | |
| | | 1÷3600 | : timeout expressed in sec |
| <cleanSession> | integer | 1 | Indicates whether a persistent connection is required. Without a persistent connection, when the client is offline all information and messages that are queued from a previous persistent session are lost. |
| | | Values: | |
| | | 1 | : clean session |

0 : persistent session

AT#MQCFG2?

Read command returns the configuration of all active MQTT clients in the format:

#MQCFG2: <instanceNumber>,<keepAlive>,<cleanSession>

AT#MQCFG2=?

Test command reports the available range of values for parameters.

```
AT# MQCFG2=1,20,1
OK
```

```
Read command
AT#MQCFG2?
#MQCFG2: 1,20,1
#MQCFG2: 2,30,1
OK
```

```
Test command
AT#MQCFG2=?
#MQCFG2: (1-maxClients),(1-3600),(0-1)
```

3.24.6. AT#MQWCFG - Configure MQTT Last Will and Testament

This command sets Last Will and Testament for the selected MQTT client.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

➡ **AT#MQWCFG=<instanceNumber>,<willFlag>[,<willRetain>,<willQos>,<willTopic>,<willMsg>]**

Parameters:

| Name | Type | Default | Description |
|-------------------------------|--------------|---------|---|
| <instanceNumber> | integer | N/A | selects the client instance. The list of available clients is obtained with AT#MQEN? or the read command. |
| | | Value: | |
| | 1÷maxClients | : | client instance range. To know maxClients value use test command |
| <willFlag> | integer | 0 | selects whether the client needs to specify a Last Will and Testament. If set to 0, this is the last parameter to be set. |
| | | Values: | |
| | 0 | : | the client does not need to specify a Last Will and Testament |
| | 1 | : | the client needs to specify a Last Will and Testament |
| <willRetain> | integer | 0 | selects whether the Last Will message needs to be retained by the server |

Values:

0 : the Last Will message does not need to be retained by the server

1 : the Last Will message needs to be retained by the server

| | | | |
|------------------------|---------|---|---|
| <willQos> | integer | 0 | Quality of Service of the Last Will message |
|------------------------|---------|---|---|

Value:

0÷2 : Quality of Service range

| | | | |
|--------------------------|--------|---|---|
| <willTopic> | string | - | Topic to publish the Last Will message to. Unused. Maximum length of <willTopic> is 256. |
|--------------------------|--------|---|---|

| | | | |
|------------------------|--------|---|--|
| <willMsg> | string | - | Last Will message. Maximum length of <willMsg> is 1024. |
|------------------------|--------|---|--|

AT#MQWCFG?

Read command returns the Last Will and Testament (if any) of all active MQTT clients in the format:

#MQWCFG:<instanceNumber>,<willFlag>[,<willRetain>,<willQos>,<willTopic>,<willMsg>]

AT#MQWCFG=?

Test command reports the available range of values for parameters.

```
AT#MQWCFG=1,0  
OK
```

```
AT#MQWCFG=1,1,1,2,myLastWillTopic,myLastWillMessage  
OK
```

```
Read command  
AT#MQWCFG?  
#MQWCFG: 1,0  
#MQWCFG: 2,1,0,2,myTopic,myMessage  
OK
```

```
Test command  
AT#MQWCFG=?  
#MQWCFG: (1-maxClients),(0-1),(0-1),(0-2),256,1024  
OK
```

3.24.7. AT#MQUNS - Unsubscribe from a Topic

This command revokes the subscription to a MQTT topic.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQUNS=<instanceNumber>,<topic>**

Parameters:

| Name | Type | Default | Description |
|------------------|--------------|---------|--|
| <instanceNumber> | string | N/A | selects the client instance to activate or deactivate |
| Value: | | | |
| | 1÷maxClients | : | client instance range. To know maxClients value use test command |
| <topic> | string | - | name of the topic. Maximum length of <topic> is 256. |

 **AT#MQUNS=?**

Test command reports the available range of values for parameters.

```
</> AT#MQUNS=1,topicToUnsubscribe
OK
Test command
AT#MQUNS=?
#MQUNS: {1-maxClients},
OK
```

3.24.8. AT#MQTCFG - Configure Timeout Parameters for MQTT Transmission

This command writes the timeout options for the specified client.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQTCFG=<instanceNumber>,<pktTimeout>

Parameters:

| Name | Type | Default | Description |
|------------------|--------|---------|--|
| <instanceNumber> | string | N/A | selects the client instance. The list of available clients is obtained with AT#MQEN? or the read command. |

Value:

1÷maxClients : client instance range. To know maxClients value use test command

| | | | |
|--------------|---------|----|--------------------------------|
| <pktTimeout> | integer | 10 | timeout of the packet delivery |
|--------------|---------|----|--------------------------------|

Value:

1÷60 : timeout range. Value expressed in seconds

AT#MQTCFG?

Read command returns the timeout configuration of all active MQTT clients in the format

#MQTCFG: <instanceNumber>,<pktTimeout>

AT#MQTCFG=?

Test command reports the available range of values for parameters

</> **AT#MQTCFG=1,10**
OK

Read command

AT#MQTCFG?

#MQTCFG: 1,5

#MQTCFG: 1,4

OK

Test command

AT#MQTCFG=?

#MQTCFG: (1-maxClients),(1-60)

OK

3.24.9. AT#MQSUB - Subscribe to a Topic

This command performs the subscription to a MQTT topic

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQSUB=<instanceNumber>,<topic>

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | selects the client instance to activate or deactivate |

Value:

1÷maxClients : client instance range. To know maxClients value use test command

| | | | |
|---------|--------|---|---|
| <topic> | string | - | name of the topic. Maximum length of <topic> is 256. |
|---------|--------|---|---|

AT#MQSUB=?

Test command reports the available range of values for parameters.

```
AT#MQSUB=1,topicToSubscribe  
OK
```

Test command

```
AT#MQSUB=?  
#MQSUB: (1-maxClients),256  
OK
```

3.24.10. AT#MQPUBS - Publish ASCII String

This command publishes an ASCII string to the specified MQTT topic.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQPUBS=<instanceNumber>,<topic>,<retain>,<qos>,<message>**

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|--|
| <instanceNumber> | string | N/A | selects the client instance to activate or deactivate |
| Value: | | | |
| 1÷maxClients : client instance range. To know maxClients value use test command | | | |
| <topic> | string | - | name of the topic. Maximum length of <topic> is 256. |
| <retain> | integer | N/A | specifies if the broker must retain this message or not |
| Values: | | | |
| 0 : retain | | | |
| 1 : no retain | | | |
| <qos> | integer | N/A | specifies the Quality of Service of this message |
| Value: | | | |
| 0÷2 : Quality of Service range | | | |
| <message> | string | - | message to publish on the topic. |

Maximum length of <message>
can go up to 65536 depending on
system memory available.

 **AT#MQPUBS=?**

Test command reports the available range of values for parameters.

 **AT#MQPUBS=1,myTopic,0,0,myMessage**
OK

Test command

AT#MQPUBS=?

#MQPUBS: (1-maxClients),256,(0-1),(0-2),65536

OK

3.24.11. AT#MQREAD - Read Messages Received from the MQTT Broker

This command reads the message payload from the queue slot provided.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQREAD=<instanceNumber>,<mld>**

After command line is terminated with <CR>, the module responds sending:

#MQREAD: <instanceNumber>,<topic>,<payload_len>,

then the module prompts the following characters sequence:

<less_than><less_than><less_than><carriage return><line feed> (IRA 60, 60, 60, 13, 10)

followed by the data

Parameters:

| Name | Type | Default | Description |
|-------------------------------|--------------|---------|---|
| <instanceNumber> | string | N/A | selects the client instance to activate or deactivate |
| | Value: | | |
| | 1÷maxClients | : | client instance range. To know maxClients value use test command |
| <mld> | integer | N/A | message slot Id to be read. The read operation will free the slot resource. |
| | Value: | | |

1÷30 : message slot Id range

Additional info:

►► UNSOLICITED MESSAGE:

#MQRING - Received data on subscribed topic

When a message is received on the subscribed topic, an URC message is sent to all AT commands interfaces. There are 30 messages slots available for incoming messages, and it is responsibility of the user to keep them empty by reading them with #MQREAD.

25. If the message queue is full, and a new message arrives, the following URC **#MQRING: 0** is received.

26. Otherwise, for normal messages, the URC format is:
#MQRING: <instanceNumber>,<mld>,<topic>,<len>

In the Unsolicited fields section are described the URC message parameters not described in the previous sections.

Unsolicited fields:

| Name | Type | Description |
|---------|---------|---|
| <topic> | string | name of the topic from where the message was received |
| <len> | integer | length in bytes of the received payload |

AT#MQREAD?

Read command returns the unread messages count for each instance number for all active MQTT clients in the format:

#MQREAD: <instanceNumber>,<unread>

AT#MQREAD=?

Test command reports the available range of values for parameters.

```
AT#MQREAD=1,2
#MQREAD: 1,myTopic,10
<<<
0123456789
```

Read command

```
AT#MQREAD?
#MQREAD: 1,0
#MQREAD: 2,3
OK
```

Test command

```
AT#MQREAD=?
#MQREAD: (1-maxClients),(1-30)
OK
```

3.24.12. MQTT-SN

3.24.12.1. AT#MQSNEN - Enable MQTT-SN feature

This command initializes a MQTT-SN client and allocates the necessary resources.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

**AT#MQSNEN=<instanceNumber>,<enable>**

Set command enables/disables the MQTT-SN client for further configuration and usage

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | Selects the client instance to activate or deactivate. The list of available clients is obtained with the read command. To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

| | | | |
|----------|---------|-----|--|
| <enable> | integer | N/A | Sets if the selected client must be activated or deactivated |
|----------|---------|-----|--|

Values:

1 : Enable

0 : Disable

**AT#MQSNEN?**

Read command returns the status of the MQTT-SN stack in the format
#MQSNEN: <instanceNumber>,<enabled>

**AT#MQSNEN=?**

Test command reports the available range of values for parameters.

- Set example
AT#MQSNEN=1,1

OK
- Read example
AT#MQSNEN?
#MQSNEN: 1,1
#MQSNEN: 2,0

OK
- Test example (refer to module output for real ranges)
AT#MQSNEN=?
#MQSNEN: (1-maxClients),(0-1)

OK

3.24.12.2. AT#MQSNCFG2 - Configure additional MQTT-SN parameters

This command sets the optional connection parameters for the selected MQTT-SN client

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#MQSNCFG2=<instanceNumber>,<keepalive>,<clean_session>**

Set command writes the MQTT-SN parameters for the specified client

Parameters:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of available clients is obtained with AT#MQSNEN? or the read command. To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <keepalive> | integer | 20 | Timeout of periodic packet to keep connection open |
| Values: | | | |
| 20 : Default timeout 20 seconds | | | |
| 1÷3600 : Timeout in seconds | | | |
| <clean_session> | integer | 1 | Indicates whether or not a persistent connection is required. Without a persistent connection, when the client is offline all information and messages that are queued from |

a previous persistent session
are lost.

Values:

1 : clean session

0 : persistent session

AT#MQSNCFG2?

Read command returns the configuration all active MQTT-SN clients in the format

#MQSNCFG2: <instanceNumber>,<keepalive>,<clean_session>

AT#MQSNCFG2=?

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNCFG2=1,120,1
```

```
OK
```

```
AT#MQSNCFG2=2,90,0
```

```
OK
```

- Read example

```
AT#MQSNCFG2?  
#MQSNCFG2: 1,120,1  
#MQSNCFG2: 2,90,0
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNCFG2=?  
#MQSNCFG2: (1-maxClients),(1-3600),(0-1)
```

```
OK
```

3.24.12.3. AT#MQSNREG - Register to a Topic

Performs the subscription to a MQTT-SN topic

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQSNREG=<instanceNumber>,<topic>

Registers to a topic and displays topic id received upon success

Parameters:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of active clients is obtained with AT#MQSNCONN? To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <topic> | string | - | Name of the topic. Maximum length supported is 256. |

Additional info:

- ▶▶ In case of success, execution command returns topic id received for the specified topic in the format:
#MQSNREG: <topic_id>

AT#MQSNREG=?

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNREG=1,topicToRegister  
#MQSNREG: 1
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNREG=?  
#MQSNREG: (1-maxClients),256
```

```
OK
```

3.24.12.4. AT#MQSNPUBS - Publish to the specific topic

Publishes an ASCII string to the specified MQTT-SN topic

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQSNPUBS=<instanceNumber>,<topic_type>,<topic/topicId>,<retain>,<qos>,<message>**

Publishes a string to a topic

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of active clients is obtained with AT#MQSNEN? To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <topic_type> | integer | N/A | Type of topic/topic id |
| Values: | | | |
| 0 : Normal topic id (received from AT#MQSNREG) | | | |
| 1 : Pre-defined topic id | | | |
| 2 : Short topic | | | |
| <topic/topicId> | string | - | Normal topic id or short topic or pre-defined topic id. Maximum length is 2. |

| | | | |
|-----------------------|---------|-----|--|
| <retain> | integer | N/A | Specifies if the Gateway must retain this message or not |
|-----------------------|---------|-----|--|

Values:

0 : Do not retain

1 : Must retain

| | | | |
|--------------------|---------|-----|--|
| <qos> | integer | N/A | Specifies the Quality of Service of this message |
|--------------------|---------|-----|--|

Values:

0 : At most once delivery

1 : At least once delivery

2 : Exactly once delivery

3 : Publish with QoS -1

| | | | |
|------------------------|--------|---|--|
| <message> | string | - | Message to publish on the topic. Maximum 1024 characters, printable ASCII. |
|------------------------|--------|---|--|

 In case QoS -1, only predefined topics and short topics are allowed

AT#MQSNPUBS=?

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNPUBS=1,0,1,0,0,myMessage
```

```
OK
```

```
AT#MQSNPUBS=1,1,ab,0,1,myMessage
```

```
OK
```

```
AT#MQSNPUBS=1,2,1,0,1,myMessage
```

```
OK
```

```
AT#MQSNPUBS=1,1,ab,0,3,myMessage
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNPUBS=?
```

```
#MQSNPUBS: (1-maxClients),(0-2),2,(0-1),(0-3),1024
```

```
OK
```

3.24.12.5. AT#MQSNWCFG - Configure MQTT-SN last will and testament

This command sets Last Will and Testament for the selected MQTT-SN client

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

➡ **AT#MQSNWCFG=<instanceNumber>,<will_flag>[,<will_retain>,<will_qos>,<will_topic>,<will_msg>]**

Set command writes the parameters for the specified client

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of available clients is obtained with AT#MQSNEN? or the read command. To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

| | | | |
|-------------|---------|---|---|
| <will_flag> | integer | 0 | Selects whether the client needs to specify a Last Will and Testament. If set to 0, this is the last parameter to be set. |
|-------------|---------|---|---|

Values:

0 : The client does not need to specify a Last Will and Testament

1 : The client needs to specify a Last Will and Testament

| | | | |
|----------------------------|---------|---|---|
| <will_retain> | integer | 0 | Selects whether the Last Will message needs to be retained by the server. |
|----------------------------|---------|---|---|

Values:

0 : The Last Will message does not need to be retained by the server

1 : The Last Will message needs to be retained by the server

| | | | |
|-------------------------|---------|---|---|
| <will_qos> | integer | 0 | Quality of Service of the Last Will message |
|-------------------------|---------|---|---|

Values:

0 : Default value

0÷2 : Quality of Service

| | | | |
|---------------------------|--------|---|---|
| <will_topic> | string | - | Topic to publish the Last Will message to. Maximum size is 256. |
|---------------------------|--------|---|---|

| | | | |
|-------------------------|--------|---|--|
| <will_msg> | string | - | Last Will message. Maximum size is 1024. |
|-------------------------|--------|---|--|

AT#MQSNWCFG?

Read command returns the Last Will and Testament (if any) of all active MQTT-SN clients in the format

#MQSNWCFG:

<instanceNumber>,<will_flag>[,<will_retain>,<will_qos>,<will_topic>,<will_message>]

AT#MQSNWCFG=?

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNWCFG=1,0
```

```
OK
```

```
AT#MQSNWCFG=1,1,1,2,myLastWillTopic,myLastWillMessage
```

```
OK
```

- Read example

```
AT#MQSNWCFG?
```

```
#MQSNWCFG: 1,0
```

```
#MQSNWCFG: 1,1,1,2,myLastWillTopic,myLastWillMessage
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNWCFG=?
```

```
#MQSNWCFG: (1-maxClients),(0-1),(0-1),(0-2),256,1024
```

```
OK
```

3.24.12.6. AT#MQSNSUB - Subscribe to a Topic

Performs the subscription to a MQTT-SN topic.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQSNSUB=<instanceNumber>,<qos>,<topic_type>,<topic/topic_id>**

Subscribes to a topic.

Parameters:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of active clients is obtained with AT#MQSNCONN? To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <qos> | integer | N/A | Desired Quality of service for the topic to be subscribed. |
| Value: | | | |
| 0÷2 : Quality of service | | | |
| <topic_type> | integer | 0 | Type of topic to be subscribed |
| Values: | | | |
| 0 : Normal topic | | | |
| 1 : Pre-defined topic | | | |
| 2 : Short topic | | | |

| | | | |
|-------------------------------|--------|---|---|
| <topic/topic_id> | string | - | Name of the topic or short topic or pre-defined topic id. Maximum length supported is 256. |
|-------------------------------|--------|---|---|

Additional info:

- ▶▶ In case of success, execution command returns qos granted and topic id received (in case of normal topic) in the format:
#MQSNSUB: <qos>[,<topic_id>]

AT#MQSNSUB=?

Test command reports the available range of values for parameters

- Set example
`AT#MQSNSUB=1,1,0,topicToSubscribe`
`#MQSNSUB: 1,1`

`OK`

`AT#MQSNSUB=1,1,1,5`
`#MQSNSUB: 1`

`OK`

`AT#MQSNSUB=1,1,2,ab`
`#MQSNSUB: 1`

`OK`
- Test example (refer to module output for real ranges)

```
AT#MQSNSUB=?  
#MQSNSUB: (1-maxClients),(0-2),(0-2),256
```

```
OK
```

3.24.12.7. AT#MQSNCFG - Configure MQTT-SN parameters

This command sets the connection parameters for the selected MQTT-SN client

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#MQSNCFG=<instanceNumber>,<hostname>,<port>,<cid>

Set command writes the MQTT-SN parameters for the specified client

Parameters:

| Name | Type | Default | Description |
|---|---------|---------|---|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of available clients is obtained with AT#MQSNEN? or the read command. To know maxClients value use test command |
| Value: 1÷maxClients : client instance Number | | | |
| <hostname> | string | - | URL of the MQTT-SN Gateway. Maximum length of URL is 512. |
| <port> | integer | N/A | UDP port of the MQTT-SN Gateway |
| Value: 1÷65535 : UDP port | | | |
| <cid> | integer | N/A | PDP Context ID to be used for the connection |
| Value: 1÷6 : PDP Context ID | | | |

**AT#MQSNCFG?**

Read command returns the configuration all active MQTT-SN clients in the format

#MQSNCFG: <instanceNumber>,<hostname>,<port>,<cid>

**AT#MQSNCFG=?**

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNCFG=1,api.myGateway.com,11000,3
```

```
OK
```

- Read example

```
AT#MQSNCFG?
```

```
#MQSNCFG: 1,api.myGateway.com,11000,1
```

```
#MQSNCFG: 2, Gateway.com,11000,1
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNCFG=?
```

```
#MQSNCFG: (1-maxClients),512,(1-65535),(1-6)
```

```
OK
```

3.24.12.8. AT#MQSNTCFG - Configure timeout parameters for MQTT-SN transmission

This command sets the timeout options for the selected MQTT-SN client.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#MQSNTCFG=<instanceNumber>,<pkt_timeout>

Set command writes the timeout options for the specified client.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of available clients is obtained with AT#MQSNEN? or the test command. To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

| | | | |
|---------------|---------|----|---------------------------------|
| <pkt_timeout> | integer | 10 | Timeout of the packet delivery. |
|---------------|---------|----|---------------------------------|

Values:

10 : Default timeout 10 seconds

1÷60 : Timeout in seconds

AT#MQSNTCFG?

Read command returns the timeout configuration of all active MQTT-SN clients in the format

#MQSNTCFG: <instanceNumber>,<pkt_timeout>

 **AT#MQSNTCFG=?**

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNTCFG=1,10
```

```
OK
```

- Read example

```
AT#MQSNTCFG?  
#MQSNTCFG: 1,5  
#MQSNTCFG: 1,20
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNTCFG=?  
#MQSNTCFG: (1-maxClients),(1-60)
```

```
OK
```

3.24.12.9. AT#MQSNDISC - Log out and disconnect from the MQTT-SN Gateway

Performs the logout and disconnection from to the MQTT-SN Gateway.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQSNDISC=<instanceNumber>

Disconnects gracefully from the MQTT-SN Gateway, then closes the network connection and socket.

Parameter:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of active clients is obtained with AT#MQSNEN? To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

AT#MQSNDISC=?

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNDISC=1
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNDISC=?  
#MQSNDISC: (1-maxClients)
```

```
OK
```

3.24.12.10. AT#MQSNUNS - Unsubscribe from a Topic

Revokes the subscription to a MQTT-SN topic

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQSNUNS=<instanceNumber>,<topic_type>,<topic/topic_id>**

Unsubscribes from a topic

Parameters:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The list of active clients is obtained with AT#MQSNCONN? To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <topic_type> | integer | 0 | Type of topic |
| Values: | | | |
| 0 : Normal topic | | | |
| 1 : Pre-defined topic | | | |
| 2 : Short topic | | | |
| <topic/topic_id> | string | - | Name of the topic or short topic or pre-defined topic id. Maximum size is 256. |

 **AT#MQSNUNS=?**

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNUNS=1,0,topicToUnsubscribe
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNUNS=?
```

```
#MQSNUNS: (1-maxClients),(0-2),256
```

```
OK
```

3.24.12.11. AT#MQSNREAD - Read messages received from the MQTT-SN Gateway

Read the message payload from the queue slot provided.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQSNREAD=<instanceNumber>,<mld>**

Read the message from the slot and for the provided client. The command will respond with

#MQSNREAD: <instanceNumber><topic_type>,<topic_id>,<payload_len>

Then the device shall prompt a characters sequence

<less_than><less_than><less_than><carriage return><line feed>

(IRA 60, 60, 60, 13, 10)

followed by the data

Parameters:

| Name | Type | Default | Description |
|-----------------------------------|---------|---------|--|
| <instanceNumber> | integer | - | Select the client instance. The list of active clients is obtained with AT#MQSNEN? Values: 1..<maxClients> To know maxClients value use test command. |
| <mld> | integer | N/A | The message slot Id to be read. The read operation will free the slot resource |
| Value: | | | |
| 1÷30 : message slot Id to be read | | | |

Additional info:

- When a message is received on the subscribed topic, an URC message is sent to all AT commands interfaces. There are 30 messages slots available for incoming messages, and it is responsibility of the user to keep them empty by reading them with **#MQSNREAD**. If the message queue is full, and a new message arrives, an URC

#MQSNRING: 0

is received.

Otherwise, for normal messages, the URC format is

#MQSNRING:

<instanceNumber>,<mid>,<topic_type>,<topic/topicId>,<len>

Unsolicited fields:

| Name | Type | Description |
|-------------------------------|---------|--|
| <instanceNumber> | integer | Selects the client instance. The list of active clients is obtained with AT#MQSNEN? Value: 1..<maxClients> To know maxClients value use test command. |
| <mid> | integer | message slot id number, to be used to read the message content with AT#MQSNREAD command. Value: 1-30 : message slot id number |
| <topic_type> | integer | Type of topic/topic id. Values: 0 : Normal topic id (received from AT#MQSNREG) 1 : Pre-defined topic id |

2 : Short topic

| | | |
|------------------------------|---------|---|
| <topic/topicId> | string | Normal topic id or short topic or pre-defined topic id. |
| <len> | integer | Length in bytes of the received payload |

AT#MQSNREAD?

Read command returns the unread messages count for each instance number for all active MQTT-SN clients in the format

#MQSNREAD: <instanceNumber>,<unread>

AT#MQSNREAD=?

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNREAD=1,2
#MQSNREAD: 1,1,ab,10
<<<
0123456789
```

OK

- Read example

```
AT#MQSNREAD?
#MQSNREAD: 1,0
#MQSNREAD: 2,3
```

OK

- Test example (refer to module output for real ranges)

```
AT#MQSNREAD=?
#MQSNREAD: (1-maxClients),(1-30)
```

OK

3.24.12.12. AT#MQSNWTUP - Update MQTT-SN last will and testament Topic

Set Last Will and Testament for the selected MQTT-SN client

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#MQSNWTUP=<instanceNumber><will_flag>[,<will_retain>,<will_qos>,<will_topic>]**

Send will topic update packet to the Gateway

Parameters:

| Name | Type | Default | Description |
|---------------|---------|--|--|
| <will_retain> | integer | 0 | Selects whether the Last Will message needs to be retained by the server |
| Values: | | | |
| 0 | : | The Last Will message does not need to be retained by the server | |
| 1 | : | The Last Will message needs to be retained by the server | |
| <will_qos> | integer | 0 | Quality of Service of the Last Will message |
| Value: | | | |
| 0÷2 | : | Quality of Service | |
| <will_topic> | string | - | Topic to publish the Last Will message to |

 **AT#MQSNWTUP=?**

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNWTUP=1,0
```

```
OK
```

```
AT#MQSNWTUP=1,1,1,2,myLastWillTopic
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNWTUP=?
```

```
#MQSNWTUP: (1-maxClients),(0-1),(0-1),(0-2),
```

```
OK
```

3.24.12.13. AT#MQSNWMUP - Update MQTT-SN last will and testament Message

Set Last Will and Testament for the selected MQTT-SN client

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#MQSNWMUP=<instanceNumber>,<will_msg>

Send will message update packet to the Gateway

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | - | Selects the client instance. The list of available clients is obtained with AT#MQSNEN? or the read command. Value: 1..<maxClients> To know maxClients value use test command. |
| <will_msg> | string | - | Message of the Last Will message |

AT#MQSNWMUP=?

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNWMUP=1,myLastWillMessage  
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNWMUP=?  
#MQSNWMUP: (1-maxClients),  
  
OK
```

3.24.12.14. AT#MQSNSTATE - Set MQTT-SN client state

This command initializes a MQTT-SN client and allocates the necessary resources.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#MQSNSTATE=<instanceNumber>,<state>[,<duration>]**

Set command changes the MQTT-SN client state to "asleep", "awake" or "active" state.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <instanceNumber> | integer | - | Selects the client instance to activate or deactivate. The list of available clients is obtained with the read command. Value: 1..<maxClients> To know maxClients value use test command. |
| <state> | integer | N/A | Desired state of the MQTT-SN client. |

Values:

- 0 : Active state. This is the normal connected state in which all the MQTT-SN operations can be performed. This option is valid only if client is in asleep state
- 1 : Asleep State: Client can enter asleep state whenever they are not active, and can become active whenever they have data to send or to receive. In this state, no MQTT-SN operation can be performed except sending keep-alive packets. User has to specify periodic duration of sleep state.

Else, the command fails. This option is valid only if client is in active state.

- 2 : Awake state: Required only to go to asleep state. Sleeping client will send a keep-alive packet to the gateway, receive all the buffered Publish packets sent by the gateway and will again go to asleep state. This option is valid only if client is in asleep state.

| | | | |
|-------------------------|---------|---|--|
| <duration> | integer | - | Sets the period of clients sleep in seconds. After expiry of this duration, the client sends a keep-alive packet to the gateway, receives all the buffered Publish packet sent by the gateway and again goes to asleep state. This parameter is mandatory if user is setting value of <state> parameter to 1. |
|-------------------------|---------|---|--|

AT#MQSNSTATE?

Read command returns the state of all initialised MQTT-SN clients in the format

#MQSNSTATE: <instanceNumber>,<state>[,<duration>]

AT#MQSNSTATE=?

Test command reports the available range of values for parameters.

- Set example

```
AT#MQSNSTATE=1,0  
OK
```

```
AT#MQSNSTATE=1,1,60  
OK
```

```
AT#MQSNSTATE=1,2  
#MQSNRING:1,5,2,ab,10  
OK
```

- Read example

```
AT#MQSNSTATE?  
#MQSNSTATE: 1,1,60  
#MQSNSTATE: 2,0  
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNSTATE=?  
#MQSNSTATE: (1-maxClients),(0-2)  
OK
```

3.24.12.15. AT#MQSNSOCK - Enable/disable MQTT-SN client socket

Performs the connection and login to the MQTT-SN Gateway

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#MQSNSOCK=<instanceNumber>,<create>**

Set command creates/closes UDP socket for MQTT-SN client. User can either directly Publish on QoS -1 after creating the socket or can connect to the gateway and then perform other MQTT-SN operations.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The number of available clients is obtained with the test command. To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

| | | | |
|----------|---------|-----|--|
| <create> | integer | N/A | Sets if the selected client socket must be created or closed |
|----------|---------|-----|--|

Values:

1 : Create socket

0 : Close socket. To be used when client is in socket connected state

**AT#MQSNSOCK?**

Read command reports the socket state of active MQTT-SN clients in the format:

#MQSNSOCK =<instanceNumber>,<socket_created>

AT#MQSNSOCK=?

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNSOCK=1,1
```

```
OK
```

- Read example

```
AT#MQSNSOCK?  
#MQSNSOCK: 1,1  
#MQSNSOCK: 2,0
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNSOCK=?  
#MQSNSOCK: (1-maxClients),(0-1)
```

```
OK
```

3.24.12.16. AT#MQSNCONN - Connect and log in the MQTT-SN Gateway

Performs the connection and login to the MQTT-SN Gateway

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#MQSNCONN=<instanceNumber>,<clientID>

Set command performs network connection (using parameters set with #MQSNCFG) and sends the CONNECT packet to the MQTT-SN Gateway.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|--|
| <instanceNumber> | integer | N/A | Selects the client instance. The number of available clients is obtained with the test command. To know maxClients value use test command. |

Value:

1÷maxClients : client instance Number

| | | | |
|------------|--------|---|---|
| <clientID> | string | - | Client identifier. Identifies each MQTT-SN client that connects to the MQTT-SN Gateway. Maximum length is 23. |
|------------|--------|---|---|

-  A URC message in the following format is sent to notify user about asynchronous disconnect:

#MQSNCONN: <instanceNumber>,DISCONNECT

Where, <instanceNumber> is the client instance of the MQTT-SN client disconnected.

- i** If **#MQSNCONN** URC is received, socket is closed internally and client moves to init state. User can establish the connection again with **AT#MQSNSOCK** and **AT#MQSNCONN** commands.

AT#MQSNCONN?

Read command reports the configuration of active MQTT-SN connections in the format:

#MQSNCONN=<instanceNumber>,<state>

Additional info:

▶▶ Parameter:

| Name | Type | Default | Description |
|---------------------------------------|---------|---------|---|
| <instanceNumber> | integer | N/A | Selects the client instance. The number of available clients is obtained with the test command. To know maxClients value use test command. |
| Value: | | | |
| 1÷maxClients : client instance Number | | | |
| <state> | integer | N/A | Client status. |
| Values: | | | |
| 0 : client is in init state | | | |
| 1 : socket is created | | | |
| 2 : client is connected | | | |

-
- 3 : connection closed by the gateway.
Issue AT#MQSNSOCK and
AT#MQSNCONN to open connection
again
 - 4 : Ping request failed
 - 5 : Connect request timed out
 - 6 : Client is in "asleep" state
 - 7 : Client is in "awake" state
 - 8 : Client is in unknown state. Deinit
client and open it again with
AT#MQSNEN
-

 **AT#MQSNCONN=?**

Test command reports the available range of values for parameters

- Set example

```
AT#MQSNCONN=1,myClientID
```

- Read example

```
AT#MQSNCONN?  
#MQSNCONN: 1,2  
#MQSNCONN: 2,3
```

```
OK
```

- Test example (refer to module output for real ranges)

```
AT#MQSNCONN=?  
#MQSNCONN: (1-maxClients),23
```

```
OK
```

3.25. GNSS

3.25.1. GNSS Configuration

3.25.1.1. AT\$GPSCFG - Set GNSS Configuration Parameters

This command sets the following GNSS parameters: WWAN/GNSS startup priority, TBF (Time Between Fix), constellation and WWAN/GNSS runtime priority and static pinning operation.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

 **AT\$GPSCFG=<parameter>,<value>**

Parameters:

| Name | Type | Default | Description |
|-------------|---------|---------|---|
| <parameter> | integer | N/A | selects the configuration parameter to be set |

Values:

0 : set WWAN/GNSS startup priority

1 : set TBF

2 : set constellation

3 : set WWAN/GNSS runtime priority

4 : set static pinning operation

| | | | |
|---------|---------|---|--|
| <value> | integer | - | value depends on the first parameter. See Additional info section. |
|---------|---------|---|--|

Additional info:

- ▶▶ <parameter>=0, in this case the <value> assumes the meaning of <startup priority>.

| Name | Type | Default | Description |
|--------------------|---------|---------|--|
| <startup priority> | integer | 1 | it selects the priority, stored in NVM and effective from module startup |
| Values: | | | |
| 0 : priority GNSS | | | |
| 1 : priority WWAN | | | |

- ▶▶ <parameter>=1, in this case the <value> assumes the meaning of <TBF>.

| Name | Type | Default | Description |
|----------------------------------|---------|---------|---------------------------------|
| <TBF> | integer | 1 | it defines the Time Between Fix |
| Value: | | | |
| 1÷4294967 : expressed in seconds | | | |

- ▶▶ <parameter>=2, in this case the <value> assumes the meaning of <constellation>.

| Name | Type | Default | Description |
|--|---------|---------|---------------------------|
| <constellation> | integer | 1 | selects the constellation |
| Values: | | | |
| 0 : the constellation is selected automatically based on Mobile Country Code (MCC) of camped network | | | |
| 1 : GPS+GLO | | | |

- 2 : GPS+GAL
- 3 : GPS+BDS
- 4 : GPS+QZSS

- ▶▶ **<parameter>=3**, in this case the **<value>** assumes the meaning of **<runtime priority>**.

| Name | Type | Default | Description |
|---------------------------------|---------|---------|---------------------------------|
| <runtime priority> | integer | N/A | it selects the priority runtime |
| Values: | | | |
| | 0 | | priority GNSS |
| | 1 | | priority WWAN |

- ▶▶ **<parameter>=4**, in this case the **<value>** assumes the meaning of **<static pinning>**.

| Name | Type | Default | Description |
|-------------------------------|---------|---------|-----------------------------------|
| <static pinning> | integer | 1 | Sets the static pinning operation |
| Values: | | | |
| | 0 | | Disable static pinning |
| | 1 | | Enable static pinning |

-  WWAN/GNSS startup priority is stored in NVM. This is the priority setting used from the module startup.
It is possible to change priority runtime using third parameter WWAN/GNSS runtime priority.
At the startup, runtime priority is equal to startup priority (stored in NVM).
-  For WWAN/GNSS startup priority, TBF (Time Between Fix), constellation and static pinning a reboot is needed to make effective the setting.

AT\$GPSCFG?

Read command returns current values of **<startup priority>**, **<TBF>**, **<constellation>**, **<runtime priority>** and **<static pinning>** in format:
\$GPSCFG: <startup priority>,<TBF>,<constellation>,<runtime priority>,<static pinning>

AT\$GPSCFG=?

Test command returns supported values range of **<parameter>**, **<priority>**, **<TBF>**, **<constellation>**, **<runtime priority>** and **<static pinning>**

- Set WWAN/GNSS Startup Priority, TBF (Time Between Fix) and constellation. A reboot is needed to make effective the setting.

Get the current values

```
AT$GPSCFG?  
$GPSCFG: 1,1,1,1  
OK
```

Set new WWAN/GNSS Startup Priority value

```
AT$GPSCFG=0,0  
OK
```

Set 4321s as new TBF value

```
AT$GPSCFG=1,4321  
OK
```

Set new constellations GPS+GAL

```
AT$GPSCFG=2,2  
OK
```

Until a reboot is done old values remain the current values

```
AT$GPSCFG?  
$GPSCFG: 1,1,1,1  
OK
```

A reboot is needed to make effective the setting

```
AT#REBOOT  
OK
```

New values are the new current values

```
AT$GPSCFG?  
$GPSCFG: 0,4321,2,0  
OK
```

Enable GNSS with the new setting

```
AT$GPSP=1
```

OK

- Set WWAN/GNSS runtime priority. It does not need a reboot to make effective the setting.

Get the current values

AT\$GPSCFG?

\$GPSCFG: 1,1,1,1

OK

Set new WWAN/GNSS runtime priority value

AT\$GPSCFG=3,0

OK

Get the current values

AT\$GPSCFG?

\$GPSCFG: 1,1,1,0

OK

Enable GNSS with the new setting

AT\$GPSP=1

OK

3.25.2. GNSS Receiver

3.25.2.1. AT\$GPSRST - Restore Default GPS Parameters

This command resets the GNSS parameters to "Factory Default" configuration

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$GPSRST

Set command resets the GNSS parameters to "Factory Default" configuration and stores them in the NVM of the cellular modules

AT\$GPSRST=?

Test command returns the **OK** result code

The module must be restarted to use the new configuration

Only GNSS parameters relative to the following AT commands can be reset in NVM: **\$GPSP**, **\$GPSNMUN** and **\$GPSNMUNEX**.

3.25.2.2. AT\$GPSSAV - Save GNSS Parameters Configuration

This command stores the current GNSS parameters in the NVM of the cellular module

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT\$GPSSAV

Execution command stores the current GNSS parameters in the NVM of the cellular module

AT\$GPSSAV=?

Test command returns the **OK** result code

The module must be restarted to use the new configuration.

Only GNSS parameters relative to the following AT commands can be saved in NVM: **\$GPSP**, **\$GPSNMUN** and **\$GPSNMUNEX**

3.25.2.3. AT\$GPSP - GNSS Controller Power Management

This command powers on/off GNSS controller .

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT\$GPSP=<status>

The set command manages the power-up/power-down of the GNSS controller.

Parameter:

| Name | Type | Default | Description |
|----------|--------|---------|--|
| <status> | string | 0 | indicates the power status that has to be set. |

Values:

- 0 : GNSS controller is powered down
- 1 : GNSS controller is powered up

-  Power up clears GPS memory and then starts the GPS receiver. GPS data cleaning is performed on the base of the current value of the <reset_type> parameter (see \$GPSR).
-  GPS operation mode is performed on the base of the current values of \$GPSSLR configuration (see \$GPSSLR).

AT\$GPSP?

The read command reports the current value of the <status> parameter, in the format:

\$GPSP: <status>

 **AT\$GPSP=?**

The test command reports the supported values range for parameter **<status>**.

<status> value is stored through **\$GPSSAV** command.

GNSS controller is powered down

```
AT$GPSP=0
```

```
OK
```

3.25.3. GNSS General Management

3.25.3.1. AT\$GPSSW - GNSS Software Version

This command provides the GNSS module software version.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT\$GPSSW

Execution command returns the GNSS module software version in the format:

`$GPSSW: <swVersion>`

AT\$GPSSW?

Read command has the same behavior as the execution command.

AT\$GPSSW=?

Test command returns the **OK** result code

3.25.3.2. AT\$GPSR - Reset the GPS Controller

This command resets the GNSS controller.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Other | No | - | 2 |

AT\$GPSR=<resetType>

Execution command allows to reset the GNSS controller.

Parameter:

| Name | Type | Default | Description |
|-------------|---------|---------|--|
| <resetType> | integer | N/A | set the type of GNSS controller reset. |

Values:

- 0 : Factory Reset: this option clears all the GNSS memory including Clock Drift and Extended Ephemeris files stored into flash memory.
- 1 : Coldstart (No Almanac, No Ephemeris): this option clears all data that is currently stored in the internal memory of the GNSS receiver, including Last Position, Almanac, Ephemeris and Time. All assistance data including XTRA Ephemeris, almanac, SV health etc will be deleted. However, the stored Clock Drift and Extended Ephemeris are retained.
- 2 : Warmstart (No ephemeris): this option clears Ephemeris and Last Position only. Almanac and Extended Ephemeris are retained.
- 3 : Hotstart (with stored Almanac and Ephemeris): the GNSS receiver restarts by using all data that

is currently stored in the internal memory: valid Almanac, Ephemeris and Extended Ephemeris are therefore retained and used.

- ❗ At the moment a **Cold Start** is performed when **Factory Reset** is selected.
- ❗ At the moment **Hot Start** is not available

AT\$GPSR=?

Test command reports the range of supported values for parameter `<resetType>`.

 Factory reset
`AT$GPSR=0`
OK

3.25.3.3. AT\$GPSDPO - GNSS Set DPO

Set command sets the Dynamic Power Optimization (DPO) Control value in NV item 05596.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$GPSDPO=<DPO>

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|--------------------|
| <DPO> | integer | 2 | enable/disable DPO |

Values:

- 0 : DPO shall be disabled
- 1 : DPO shall be enabled with dynamic duty cycle
- 2 : DPO shall be enabled only if module is not connected to an external power source (not running on battery)

 Only GPS and GLONASS support DPO mode.

 <DPO> = 2 is equivalent to <DPO> = 1 (DPO enabled) due to External Power Source implementation.

AT\$GPSDPO?

Read command returns the current setting for DPO, in the format:
\$GPSDPO: <DPO>

AT\$GPSDPO=?

Test command reports the supported range of values for parameter <DPO>.

3.25.4. GNSS Positioning Information

3.25.4.1. AT\$GPSNMUN - Unsolicited NMEA Data Configuration

Set command activates an unsolicited GNSS data stream built with NMEA sentences on the standard serial port and defines which NMEA sentences will be available.

Refer to document [1] to have information on the NMEA sentences contents and formats.

[1] NMEA 0183 Standard

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT\$GPSNMUN=<enable>[,<GGA>,<GLL>,<GSA>,<GSV>,<RMC>,<VTG>]

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <enable> | integer | 0 | <p>Enables unsolicited GNSS data stream and selects one of the available GNSS data stream format display. <enable> parameter is also used to disable the GNSS data stream.</p> <p>Here is the list of the <enable> values. See Additional info section to have information on GNSS data stream formats.</p> |

Values:

- 0 : disable GNSS data stream
- 1 : enable the first GNSS data stream format
- 2 : enable the second GNSS data stream format

3 : enable the second GNSS data stream format, and reserve the AT interface port only for the GNSS data stream

| | | | |
|--------------------|---------|---|--|
| <GGA> | integer | 0 | enables/disables the presence of the Global Positioning System Fix Data NMEA sentence (GGA) in the GNSS data stream. |
| Values: | | | |
| 0 : disable | | | |
| 1 : enable | | | |
| <GLL> | integer | 0 | enable/disable the presence of the Geographic Position - Latitude/Longitude NMEA sentence (GLL) in the GNSS data stream. |
| Values: | | | |
| 0 : disable | | | |
| 1 : enable | | | |
| <GSA> | integer | 0 | enable/disable the presence of the GNSS DOP and Active Satellites NMEA sentence (GSA) in the GNSS data stream. |
| Values: | | | |
| 0 : disable | | | |
| 1 : enable | | | |
| <GSV> | integer | 0 | enable/disable the presence of the Satellites in View NMEA sentence (GSV) in the GNSS data stream. |
| Values: | | | |
| 0 : disable | | | |
| 1 : enable | | | |
| <RMC> | integer | 0 | enable/disable the presence of the Recommended Minimum Specific GNSS |

Data NMEA sentence (RMC) in the GNSS data stream.

Values:

0 : disable

1 : enable

| | | | |
|--------------------|---------|---|--|
| <VTG> | integer | 0 | enable/disable the presence of the GNSS Course Over Ground and Ground Speed NMEA sentence (VTG) in the GNSS data stream. |
|--------------------|---------|---|--|

Values:

0 : disable

1 : enable

Additional info:

- ▶▶ **<enable>=1**, GNSS data stream format:
\$GPSNMUN: <NMEA SENTENCE 1><CR><LF>
 ...
\$GPSNMUN: <NMEA SENTENCE N><CR><LF>
 ...

- ▶▶ **<enable>=2**, GNSS data stream format:
<NMEA SENTENCE 1><CR><LF>
 ...
<NMEA SENTENCE N><CR><LF>
 ...

- ▶▶ **<enable>=3**, in this case, the AT interface port is dedicated to NMEA sentences, it is not possible to send AT commands. Use the escape sequence "+++" to return in command mode. GNSS data stream format:

<NMEA SENTENCE 1><CR><LF>

...

<NMEA SENTENCE N><CR><LF>

...

The NMEA data stream format is the same as the one selected by <enable>=2.

GLL NMEA sentence is not supported.

AT\$GPSNMUN?

Read command returns whether the unsolicited GNSS data stream is currently enabled or not, along with the current NMEA mask configuration, in the format:

\$GPSNMUN:<enable>,<GGA>,<GLL>,<GSA>,<GSV>,<RMC>,<VTG >

AT\$GPSNMUN=?

Test command returns the supported range of values for parameters: <enable>, <GGA>, <GLL>, <GSA>, <GSV>, <RMC>, <VTG>.

Set the GSA as available sentence in the unsolicited message

```
AT$GPSNMUN=1,0,0,1,0,0,0
```

```
OK
```

Turn-off the unsolicited mode

```
AT$GPSNMUN=0
```

```
OK
```

Read the current NMEA mask configuration:

```
AT$GPSNMUN?
```

```
$GPSNMUN: 1,0,0,1,0,0,0
```

```
OK
```

The unsolicited message will be:

```
$GPSNMUN:
```

```
$GPGSA,A,3,23,20,24,07,13,04,02,,,,,2.4,1.6,1.8*3C
```

3.25.4.2. AT\$GPSACP - Get Acquired Position

This command returns information about the last GPS position.

[1] NMEA 0183 Standard

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT\$GPSACP

Execution command returns information about the last GPS position in the format:

\$GPSACP:

<UTC>,<latitude>,<longitude>,<hdop>,<altitude>,<fix>,<cog>,<spkm>,<spkn>,<date>,<nsat>

Additional info:

- ▶▶ Meanings of the parameters returned by the command.

| Name | Type | Default | Description |
|------------|--------|---------|--|
| <UTC> | string | - | UTC time (hhmmss.sss) referred to GGA sentence |
| <latitude> | string | - | latitude in the format ddmm.mmmm N/S (referred to GGA sentence) where: dd: 00..90, degrees mm.mmmm: 00.0000..59.9999, minutes N/S: North/South |

| | | | |
|--------------------------|---------|-----|--|
| <longitude> | string | - | longitude in the format dddmm.mmmm E/W (referred to GGA sentence) where: ddd: 000..180, degrees mm.mmmm: 00.0000..59.9999, minutes E/W: East/West |
| <hdop> | string | - | Horizontal Dilution of Precision (referred to GGA sentence) |
| <altitude> | string | - | altitude - mean-sea-level (geoid) in meters (referred to GGA sentence) |
| <fix> | integer | N/A | fix type Values: 0 : invalid fix 1 : invalid fix 2 : 2D fix 3 : 3D fix |
| <cog> | string | - | Course over Ground (degrees, True) (referred to RMC sentence) |
| <spkm> | string | - | speed over ground (Km/hr) (referred to VTG sentence) |
| <spkn> | string | - | speed over ground (knots) (referred to VTG sentence) |
| <date> | string | - | date of fix (referred to RMC sentence) in the format ddmmyy where: dd: 01..31, day mm: 01..12, month yy: 00..99, year 2000 to 2099 |

| | | | |
|---------------------------|---------|-----|--|
| <code><nsat></code> | integer | N/A | total number of satellites in use (referred to GGA sentence) |
|---------------------------|---------|-----|--|

Value:

0÷12 : total number of satellites in use

 **AT\$GPSACP?**

Read command has the same behavior as the Execution command.

 **AT\$GPSACP=?**

Test command returns the **OK** result code.

AT\$GPSP?
\$GPSP: 0

When the module is down there is no acquired position:

AT\$GPSACP
\$GPSACP: ,,,,,,0,,,,,
OK

AT\$GPSP=1
OK

Until first fix is received the command will display this:

AT\$GPSACP
\$GPSACP: ,,,,,,1,,,,,

Once fix has been received the command will display actual GPS time and position:

OK
AT\$GPSACP
\$GPSACP:
091635.000,3913.6952N,00904.1505E,0.7,17.9,3,0.0,0.0,0.0,290920,10
OK

3.25.4.3. AT\$GNSSACP - Get Acquired Position

This command returns information about the last GNSS position.

- NMEA 0183 Standard

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$GNSSACP

Execution command returns information about the last GNSS position in the format:

\$GNSSACP:

<UTC>,<date>,<latitude>,<longitude>,<altitude>,<hdop>,<vdop>,<fix>,<cog>,<spkm>,<spkn>,<mode>,<nsat>

Additional info:

- ▶ Meaning of the parameters returned by the command

| Name | Type | Default | Description |
|--------|--------|---------|---|
| <UTC> | string | - | UTC time (hhmmss.sss) referred to GGA sentence |
| <date> | string | - | date of fix (referred to RMC sentence) in the format ddmmyy where: dd: 01..31, day mm: 01..12, month yy: 00..99, year 2000 to 2099 |

| | | | |
|--------------------------|---------|-----|--|
| <latitude> | string | - | latitude in the format ddmm.mmmm N/S (referred to GGA sentence) where: dd: 00..90, degrees mm.mmmm: 00.0000..59.9999, minutes N/S: North/South |
| <longitude> | string | - | longitude in the format dddmm.mmmm E/W (referred to GGA sentence) where: ddd: 000..180, degrees mm.mmmm: 00.0000..59.9999, minutes E/W: East/West |
| <altitude> | string | - | altitude - mean-sea-level (geoid) in meters (referred to GGA sentence) |
| <hdop> | string | - | Horizontal Dilution of Precision (referred to GGA sentence) |
| <vdop> | string | - | Vertical Dilution of Precision (referred to GGA sentence) |
| <fix> | integer | N/A | fix type Values: 0 : invalid fix 1 : invalid fix 2 : 2D fix 3 : 3D fix |

| | | | |
|---------------------|---------|---|---|
| <cog> | string | - | Course over Ground (degrees, True) (referred to RMC sentence) |
| <spkm> | string | - | speed over ground (km/h) (referred to VTG sentence) |
| <spkn> | string | - | speed over ground (knots) (referred to VTG sentence) |
| <mode> | string | - | <p>Mode Indicator: six characters that indicate the operating mode of the six constellations GPS, GLONASS, Galileo, BDS, QZSS, NavIC (Not supported).</p> <p>The characters shall take one of the following values:</p> <p>A = Autonomous. D = Differential. E = Estimated (dead reckoning) Mode. F = Float RTK. M = Manual Input Mode. N = No fix. P = Precise. R = Real Time Kinematic. S = Simulator Mode.</p> <p>(referred to GNGNS sentence)</p> |
| <nsat> | integer | - | total number of satellites in use (referred to GNS sentence) |

**AT\$GNSSACP?**

Read command has the same behavior as the Execution command.

**AT\$GNSSACP=?**

Test command returns the **OK** result code.

 **AT\$GPSP?****\$GPSP: 0**

When the module is down there is no acquired position:

3.25.4.4. AT\$GPSNMUNEX - Unsolicited NMEA Extended Data Configuration

Set command activates specific GNSS NMEA sentences (related to GALILEO, GLONASS, BEIDOU and QZSS constellation) in the GNSS data stream and defines which NMEA extended sentences will be available.

GNSS data stream must be activated with **AT\$GPSNMUN** command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$GPSNMUNEX=[<GNGNS>[,<GNGSA>[,<GLGSV>[,<GPGRS>[,<GAGSV>[,<GAGSA>[,<GAVTG>[,<GPGGA>[,<PQGSA>[,<PQGSV>[,<GNVTG>[,<GNRMC>[,<GNGGA>]]]]]]]]]]]

Parameters:

| Name | Type | Default | Description |
|---------|---------|---------|---|
| <GNGNS> | integer | 0 | Fix data of GNSS (or GLONASS) receivers. |
| | Values: | | |
| | 0 | : | disable |
| | 1 | : | enable |
| <GNGSA> | integer | 0 | DOP and active satellites of GNSS (or GLONASS). |
| | Values: | | |
| | 0 | : | disable |
| | 1 | : | enable |
| <GLGSV> | integer | 0 | GLONASS satellites in view |
| | Values: | | |
| | 0 | : | disable |

1 : enable

<GPGRS> string 0 GPS Range Residuals

Values:

0 : disable

1 : enable

<GAGSV> integer 0 Galileo satellites in view

Values:

0 : disable

0.1,W,A,V*62
```

3.25.4.5. AT\$GNSSNMEA - Unsolicited NMEA Data Configuration

Set command activates an unsolicited GNSS data stream, in the form of NMEA sentences, on the standard serial port and defines which NMEA sentences will be available.

Refer to document [1] to have information on the NMEA sentences contents and formats.

[1] NMEA 0183 Standard

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|------------------|----------------|-------------|--------|
| Not required | Specific profile | No | - | 2 |

AT\$GNSSNMEA=<enable>[,<nmea_mask>]

Parameters:

| Name | Type | Default | Description |
|----------|---------|---------|---|
| <enable> | integer | 0 | Enables unsolicited GNSS data stream and selects one of the available GNSS data stream format display; <enable> parameter is also used to disable the GNSS data stream. See Additional info section to have information on GNSS data stream formats. |

Values:

0 : disable GNSS data stream

1 : enable the GNSS data stream format

- 2 : enable the GNSS data stream format and reserve the AT interface port only for the GNSS data stream

| | | | |
|--------------------------|-----|---|---|
| <nmea_mask> | hex | - | The <nmea_mask> value defines which NMEA sentences will be available (see Additional info). The default <nmea_mask> value is 0 (No sentences available). The hexadecimal format of the bit mask does not require the prefix 0x; example : 0, 1F, 3F |
|--------------------------|-----|---|---|

Additional info:

- ▶▶ Bitmap description of the **<nmea_mask>** parameter

| <nmea_mask> | Sentences |
|--------------------------|------------------|
| Bit 0 | RMC |
| Bit 1 | GGA |
| Bit 2 | GSA |
| Bit 3 | GSV |
| Bit 4 | GLL |
| Bit 5 | VTG |
| Bit 6 | ZDA |
| Bit 7 | GNS |
| Bit 8 | GRS |
| Bit 9 - 31 | Not Used |

- ▶▶ **<enable>**=1, GNSS data stream format:
<NMEA SENTENCE 1><CR><LF>
 ...
<NMEA SENTENCE N><CR><LF>
 ...

- ▶▶ **<enable>=2**, in this case the AT interface port is dedicated to NMEA sentences; it is not possible to send AT commands. Use the escape sequence "+++" to return in command mode. GNSS data stream format:

<NMEA SENTENCE 1><CR><LF>

...

<NMEA SENTENCE N><CR><LF>

...

The NMEA data stream format is the same as the one selected by **<enable>=1**.

AT\$GNSSNMEA?

Read command returns whether the unsolicited GNSS data stream is currently enabled or not, along with the current NMEA mask configuration, in the format:

\$GNSSNMEA:<enable>,<nmea_mask>

AT\$GNSSNMEA=?

Test command returns the supported range of values for parameters: **<enable>**, (list of supported **<nmea_mask>** values).

Set the GSA as available sentence in the unsolicited message

```
AT$GNSSNMEA=1,4
```

```
OK
```

Read the current NMEA mask configuration:

```
AT$GNSSNMEA?
```

```
$GNSSNMEA: 1,4
```

```
OK
```

The unsolicited message will be:

```
$GNSSNMEA:
```

```
$GNGSA,A,3,23,20,24,07,13,04,02,,,,,2.4,1.6,1.8°3C
```

Turn-off the unsolicited mode

```
AT$GNSSNMEA=0
```

```
OK
```

3.25.4.6. AT#GTP - Get Position from GTP WWAN Service

Execute command returns a position based on cellular database from GTP (Global Terrestrial Positioning) WWAN service.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#GTP

Execute command returns the following message:

#GTP: <latitude>,<longitude>,<altitude>,<accuracy>

Additional info:

- ▶▶ Meanings of the parameters returned by the command.

| Name | Type | Default | Description |
|-------------|---------|------------|--|
| <latitude> | integer | N/A | latitude specified in WGS84 datum |
| | Value: | | |
| | | -90÷90.0 | : expressed in degrees, (+/-: North / South) |
| <longitude> | integer | N/A | longitude specified in WGS84 datum |
| | Value: | | |
| | | -180÷180.0 | : expressed in degrees, (+/-: East / West) |
| <altitude> | integer | N/A | altitude with respect to the WGS84 ellipsoid |
| | Value: | | |
| | | -500÷15883 | : expressed in meters |

<accuracy> integer - horizontal position uncertainty (circular) expressed in meters

- i** Define the PDP context via **+CGDCONT** command before using **#GTP** command

?  AT#GTP=?

Test command returns the **OK** result code.

- AT#GTP**
#GTP: 12.905499, 77.648928,0, 5082.77
OK
- Consider the scenario where a client invokes GTP service to fetch the coordinates. Below is the sequence of commands to be followed

Enable the GTP. Device will reboot

AT#GTPENA=1

OK

AT+CGDCONT=<cid>,<pdp_type>,<APN>

OK

AT#GTP

#GTP: 12.905499, 77.648928,0, 5082.77

3.25.4.7. AT#GTPEN - Enable the GTP WWAN Service

This command enables the Global Terrestrial Positioning feature and reboots the device.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

AT#GTPEN=<enable>

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|----------------------|
| <enable> | integer | 0 | enables/disables GTP |

Values:

0 : disable

1 : enable

 The command performs the module reboot.

AT#GTPEN?

Read command returns current value of the parameter <enable>

AT#GTPEN=?

Test command returns range for the parameter <enable>

Enable
AT#GTPEN=1
OK

Disable
AT#GTPEN=0
OK

Read
AT#GTPEN?
#GTPEN: 0
OK

Test
AT#GTPEN=?
#GTPEN: (0-1)
OK

3.25.4.8. AT#GTPENA - Enable the GTP WWAN Service

This command enables/disables GTP (Global Terrestrial Positioning) feature.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#GTPENA=<enable>

Parameter:

| Name | Type | Default | Description |
|----------|---------|---------|----------------------|
| <enable> | integer | 0 | enables/disables GTP |

Values:

0 : disable

1 : enable

 The command performs the module reboot.

AT#GTPENA=?

Test command returns the **OK** result code.

Enable
AT#GTPENA=1
OK

Disable
AT#GTPENA=0
OK

Test
AT#GTPENA=?
#GTPENA: (0-1)
OK

3.25.5. Assisted GNSS

3.25.5.1. AT\$AGNSS - Set AGNSS Enable

This command set the AGNSS providers enable or disable. It needs a reboot to make effective the setting.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$AGNSS=<provider>,<status>

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--------------------------------------|
| <provider> | integer | N/A | selects the AGNSS provider to be set |
| Value: | | | |
| 0 : use XTRA AGNSS provider | | | |
| <status> | integer | N/A | set the AGNSS provider enable status |
| Values: | | | |
| 0 : set selected AGNSS provider disabled | | | |
| 1 : set selected AGNSS provider enabled | | | |

 Before enabling XTRA, the module must have received a valid GNSS fix. If XTRA is enabled before, the GNSS could not start.

AT\$AGNSS?

Read command returns the requested and the active status for each AGNSS provider.

\$GPSAGNSS: <provider>,<active>,<requested>

Additional info:

- ▶▶ Here are the meanings of **<active>** and **<requested>** parameters.

| Name | Type | Default | Description |
|--------------------------|---------|---------|---|
| <active> | integer | - | value showing the actual status. |
| <requested> | integer | - | value showing the requested status that will be activated on the next power ON. |

AT\$AGNSS=?

Test command returns supported values range of **< provider >**, **<status >**.

Get the active value and requested value

```
AT$AGNSS?  
$AGNSS: 0,0,0  
OK
```

Set AGNSS enable status

```
AT$AGNSS=0,1  
OK
```

Until a reboot is done active value remain and requested value change

```
AT$AGNSS?  
$AGNSS: 0,0,1  
OK
```

It needs a reboot to make effective the setting

```
AT#REBOOT  
OK
```

Active value is now the requested value

```
AT$AGNSS?  
$AGNSS: 0,1,1  
OK
```

3.25.5.2. AT\$AGNSSCFG - AGNSS Configuration

This command handles Assisted GNSS configuration. Some settings may require a reboot for the change to take effect.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT\$AGNSSCFG=<provider>,<parameter>,<value>

Parameters:

| Name | Type | Default | Description |
|--|---------|---------|--|
| <provider> | integer | N/A | select the AGNSS provider to be set |
| Value: | | | |
| 0 : use XTRA AGNSS provider | | | |
| <parameter> | integer | N/A | set the parameter to configure |
| Values: | | | |
| 0 : XTRA duration hours | | | |
| 1 : Enable or disable URCs for XTRA download | | | |
| <value> | integer | - | value depends on the previous <parameter>. See Additional info section |

Additional info:

- ▶▶ <parameter>=0: in this case, <value> handles the configuration of XTRA duration hours

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

| | | | |
|-------------------------|---------|---|---|
| <duration> | integer | 1 | select the time validity of XTRA data. It is effective only after a module reboot |
|-------------------------|---------|---|---|

Values:

0 : 24 hours (one day)
 1 : 72 hours (three days)
 2 : 168 hours (one week)

- ▶▶ **<parameter>=1**, in this case **<value>** permits to configure URCs for XTRA download

| Name | Type | Default | Description |
|---------------------|---------|---------|---|
| <URCs> | integer | 0 | enable or disable URCs for XTRA download. The effect of the command is immediate. |

Values:

0 : Disable
 1 : Enable

AT\$AGNSSCFG?

Read command returns configurations for AGNSSCFG.

Two rows will be printed.

The first row has **<parameter>=0**. It has the following form:

\$AGNSSCFG: <provider>,<parameter>,<active>,<requested>

In the second row, with **<parameter>=1**, **<requested>** has no meaning (because the configuration is applied instantly), so it is not printed:

\$AGNSSCFG: <provider>,<parameter>,<active>

Additional info:

►► Below the meanings of <active> and <requested> parameters.

| Name | Type | Default | Description |
|-------------|---------|---------|---|
| <active> | integer | - | value showing the active status currently used by the system. |
| <requested> | integer | - | value showing the requested status that will be activated on the next power ON. |

AT\$AGNSSCFG=?

Test command returns the supported value range for <provider>,<parameter>,<value>.

Get active and requested values for XTRA duration, and the availability for XTRA download status URCs:

```
AT$AGNSSCFG?
```

```
$AGNSSCFG: 0,0,1,1
```

```
$AGNSSCFG: 0,1,0
```

```
OK
```

In the above example, active and requested XTRA duration values are set to 72 hours, and URCs are not enabled.

Set XTRA duration hours = 168 hours

```
AT$AGNSSCFG=0,0,2
```

```
OK
```

Until a reboot is done, the active value remains the same but the requested value changes:

```
AT$AGNSSCFG?
```

```
$AGNSSCFG: 0,0,1,2
```

```
$AGNSSCFG: 0,1,0
```

```
OK
```

A reboot is needed for the change to take effect (requested value will become the active value)

```
AT#REBOOT
```

```
OK
```

Active value is now the previously requested value

```
AT$AGNSSCFG?
```

```
$AGNSSCFG: 0,0,2,2
```

```
$AGNSSCFG: 0,1,0
```

```
OK
```

Conversely, the effect of applying URCs availability is immediate

```
AT$AGNSSCFG=0,1,1
```

```
OK
```

The above command enables URCs, and a reboot is not required for the change to take effect

```
AT$AGNSSCFG?  
$AGNSSCFG: 0,0,2,2  
$AGNSSCFG: 0,1,1  
OK
```

3.26. Mobile Broadband

3.26.1. Ethernet Control Mode (ECM)

3.26.1.1. AT#ECM - Ethernet Control Model Setup

This command sets up an Ethernet Control Model (ECM) session.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | Auto | No | - | 2 |

AT#ECM=<Cid>,<Did>

Parameters:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <Cid> | integer | - | context id that will be used by ECM. Refer to test command to know the supported range of values. |
| <Did> | integer | - | device id, currently limited to 0 (only one device) |

-  To enable the ECM session configuration the module must be rebooted.
-  To activate an ECM session a compatible USB configuration has to be set; for details refer to the description of **#USBCFG**.

AT#ECM?

Read command returns the session state in the following format:

```
# ECM: <Did>,<State>
OK
```

Additional info:

- Here are the parameters meaning returned by the read command and not described in the previous sections.

| Name | Type | Default | Description |
|--------------|---------|---------|---------------------|
| <State> | integer | 0 | ECM session status. |
| Values: | | | |
| 0 : disabled | | | |
| 1 : enabled | | | |

AT#ECM=?

Test command returns the range of supported values for all the parameters.

| Modules supporting the command | |
|--------------------------------|-----|
| ME310G1 | -WW |
| ME910G1 | -WW |
| ML865G1 | -WW |

3.26.1.2. AT#ECMD - ECM Shutdown

This command is used to shutdown an Ethernet Control Model (ECM) session.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT#ECMD=<Did>

Parameter:

| Name | Type | Default | Description |
|-------|---------|---------|---|
| <Did> | integer | N/A | Device id, currently limited to 0 (only one device) |

Value:

0 : Device id (currently limited to only one device)

 To make active the command the module must be rebooted.

AT#ECMD?

Read command returns the session state in the following format:

#ECM: <Did>,<State>

OK

Additional info:

- ▶▶ Parameter returned by the read command and not described in the previous sections.

| Name | Type | Default | Description |
|------|------|---------|-------------|
|------|------|---------|-------------|

<State> integer 0 State of Ethernet Control Model (ECM) session

Values:

0 : disabled

1 : enable

AT#ECMD=?

Test command returns the range of supported values for **<Did>**.

Modules supporting the commands

| Modules supporting the commands | |
|---------------------------------|-----|
| ME310G1 | -WW |
| ME910G1 | -WW |
| ML865G1 | -WW |

3.27. Non-IP Data Delivery (NIDD)

3.27.1. AT#NIPDCFG - Define NIDD Parameters

This set command allows the TE to specify the parameters for a NIDD connection. It is supported by modules with NBloT technology.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#NIPDCFG=<type>,<cid>[,<userName>[,<passWord>[,<unused1>[,<unused2>]]]**
]

Parameters:

| Name | Type | Default | Description |
|-----------------------------------|---------|---------|---|
| <type> | integer | 0 | Non-IP outgoing data type |
| Values: | | | |
| 0 : MO Non-IP data type | | | |
| 1 : MO Exception Non-IP data type | | | |
| <cid> | integer | - | specifies a PDP context definition, see +CGDCONT command |
| <userName> | string | - | user name for NIDD connection |
| <passWord> | string | - | password for NIDD connection |
| <unused1> | integer | N/A | unused parameter |
| Value: | | | |
| 0 : dummy value | | | |
| <unused2> | integer | 0 | unused parameter |
| Value: | | | |

0 : dummy value

 **AT#NIPDCFG?**

Read command returns the NIDD parameters, excluding **<password>**, for every defined PDP context, in the format:

#NIPDCFG: <type>,<cid>,<username>,0,0

 **AT#NIPDCFG=?**

Test command reports the supported range of values for parameters **<type>**, **<cid>**, **<unused1>** and **<unused2>** and the maximum length for parameters **<userName>** and **<passWord>**.

3.27.2. AT#NIPDCONN - Open and Close a NIDD Connection

This command allows the TE to open and close a NIDD connection. It is supported by modules with NBloT technology.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#NIPDCONN=<mode>

Parameter:

| Name | Type | Default | Description |
|--------|---------|---------|--------------------------------|
| <mode> | integer | 0 | open/close the NIDD connection |

Values:

0 : close the NIDD connection

1 : open the NIDD connection

AT#NIPDCONN?

Read command reports the status of the NIDD connection, in the format:

#NIPDCONN: <status>

<status> has the same meaning and values of <mode> parameter.

AT#NIPDCONN=?

Test command reports the supported range of values for parameter <mode>.

3.27.3. AT#NIPDSEND - Send MO Non-IP Data

This command allows the TE to send MO Non-IP data. It is supported by modules with NB-IoT technology.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#NIPDSEND=<mode>,<data>[,<rai>]

Parameters:

| Name | Type | Default | Description |
|-------------------------|---------|---------|---|
| <mode> | integer | 0 | data format |
| Values: | | | |
| 0 : ASCII format string | | | |
| 1 : HEX format string | | | |
| <data> | string | - | data to be sent |
| <rai> | integer | 0 | RAI (release assistance indication) setting |

Values:

- 0 : No info available
- 1 : No further uplink or downlink data transmission subsequent to this transmission
- 2 : Only a single downlink data transmission and no further uplink data transmissions subsequent to this transmission

AT#NIPDSEND?

Test command reports the supported range of values for parameter **<mode>** and the maximum length of the string for parameter **<data>**.

3.27.4. AT#NIPDRECV - Retrieve Non-IP Data

This command allows the TE to retrieve the received MT Non-IP data. It is supported by modules with NBloT technology.

When MT Non-IP data are received, an unsolicited message is reported in the format:

#NIPDSRING: <recvdLen>

To get the data use **#NIPDRECV** command.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

AT#NIPDRECV=<readLen>[,<mode>]

Parameters:

| Name | Type | Default | Description |
|------------------------|---------|---------|--|
| <readLen> | integer | - | data length to be retrieved, see test command to get the available data length range. If <readLen>=0 the information about received data are queried, see Additional info section. |
| <mode> | integer | 0 | data format |

Values:

0 : ASCII format string

1 : HEX format string

Additional info:

▶▶ **<read_len>=0**

The response reports the length of received data, read data and unread data, in the format:

#NIPDRECV: <totalRecvdLen>,<totalReadLen>,<unreadLen>

| Name | Type | Default | Description |
|-----------------|---------|---------|-------------------------------|
| <totalRecvdLen> | integer | - | total length of received data |
| <totalReadLen> | integer | - | length of read data |
| <unreadLen> | integer | - | length of unread data |

Unsolicited field:

| Name | Type | Description |
|------------|---------|-------------------------|
| <recvdLen> | integer | length of received data |

AT#NIPDRECV=?

Test command reports the supported range of values for parameter <readLen>.

3.28. IMS

3.28.1. AT+CIREG - IMS registration state

The command controls the presentation of an unsolicited result code when there is a change in the MT's IMS registration information.

3GPP TS 24.229

3GPP TS 24.173

3GPP TS 24.341

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

AT+CIREG=<mode>

Unsolicited result code has the following format:

+CIREGU: <reg_info>[,<ext_info>]

Parameter:

| Name | Type | Default | Description |
|---------------------|---------|---------|--|
| <mode> | integer | 0 | enables or disables reporting of changes in the MT's IMS registration information. |

Values:

0 : disable reporting

1 : enable reporting (parameter <reg_info>).

2 : enable extended reporting (parameters <reg_info> and <ext_info>).

Unsolicited fields:

| Name | Type | Description |
|-------------------------|---------|--|
| <reg_info> | integer | <p>Indicates the IMS registration status. The UE is seen as registered if one or more of its public user identities are registered with any of its contact addresses.</p> <p>Values:</p> <p>0 : not registered.</p> <p>1 : registered.</p> |
| <ext_info> | integer | <p>the value could be either 1 or 5. It is a sum of values, each representing an IMS capability of the MT. This parameter is not present if the IMS registration status is "not registered".</p> <p>Values:</p> <p>1 : RTP-based transfer of voice according to MMTEL.</p> <p>4 : SMS using IMS functionality.</p> |

**AT+CIREG?**

Read command reports the current state of IMS registration in the format:

+CIREG: <mode>,<reg_info>[,<ext_info>]

**AT+CIREG=?**

Test command returns the supported range of values for parameter <mode>.

3.29. PSM (Power Saving Mode)

3.29.1. AT+CPSMS - Power Saving Mode Setting

This command enables/disables Power Saving Mode (PSM) mode.

[1] 3GPP TS 27 007

[2] 3GPP TS 24.008

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | Auto | No | - | 2 |

 **AT+CPSMS=[<mode>[,<ReqPeriodicRAU>[,<ReqGPRSreadyTimer>[,<ReqPeriodicTAU>[,<ReqActiveTime>]]]]]**

The set command controls the setting of the UEs power saving mode (PSM) parameters. The command controls whether the UE wants to apply PSM or not, as well as the requested extended periodic RAU value and the requested GPRS READY timer value in GERAN, the requested extended periodic TAU value in E-UTRAN and the requested Active Time value.

Parameters:

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <mode> | integer | 0 | disables or enables the use of PSM in the UE. |
| Values: | | | |
| | 0 | : | Disable |
| | 1 | : | Enable |
| <ReqPeriodicRAU> | string | - | one byte in an 8 bit format. Requested extended periodic RAU value (T3312) to be allocated to the UE in |

| | | | |
|---------------------|--------|---|---|
| | | | GERAN. The requested extended periodic RAU value is coded as one byte (octet 3) of the GPRS Timer 3 information element coded as bit format (e.g. "01000111" equals 70 hours). For the coding and the value range, see the GPRS Timer3 IE in 3GPP TS 24.008 |
| <ReqGPRSreadyTimer> | string | - | one byte in an 8 bit format. Requested GPRS READY timer value (T3314) to be allocated to the UE in GERAN. The requested GPRS READY timer value is coded as one byte (octet 2) of the GPRS Timer information element coded as bit format (e.g. "01000011" equals 3 decihours or 18 minutes). For the coding and the value range, see the GPRS Timer IE in 3GPP TS 24.008. |
| <ReqPeriodicTAU> | string | - | one byte in an 8 bit format. Requested extended periodic TAU value (T3412) to be allocated to the UE in E-UTRAN. The requested extended periodic TAU value is coded as one byte (octet 3) of the GPRS Timer 3 information element coded as bit format (e.g. "01000111" equals 70 hours). For the coding and the value range, see the GPRS Timer 3 IE in 3GPP TS 24.008. |

| | | | |
|-----------------|--------|---|--|
| <ReqActiveTime> | string | - | one byte in an 8 bit format. Requested Active Time value (T3324) to be allocated to the UE. The requested Active Time value is coded as one byte (octet 3) of the GPRS Timer 2 information element coded as bit format (e.g. "00100100" equals 4 minutes). For the coding and the value range, see the GPRS Timer 2 IE in 3GPP TS 24.008. |
|-----------------|--------|---|--|

-  A special form of the command can be given as **AT+CPSMS=** (with all parameters omitted). In this form, the parameter **<mode>** will be set to 0, the use of PSM will be disabled and data for all parameters in command **+CPSMS** will be removed or, if available, set to the manufacturer specific default values.
-  CPSMS configuration is saved in the file system

AT+CPSMS?

Read command returns the current CPSMS configuration, in the format:

```
+CPSMS:<mode>,[<ReqPeriodicRAU>],[<ReqGPRSreadyTimer>],[<ReqPeriodicTAU>], [<ReqActiveTime>]
```

AT+CPSMS=?

Test command reports the range for the parameters in the format:

```
+CPSMS:(list of supported <mode>s),(list of supported <ReqPeriodicRAU>s),(list of supported <ReqGPRSreadyTimer>s),(list of supported <ReqPeriodicTAU>s),(list of supported <ReqActiveTime>s)
```

How to manage timer values octet.

T3412ext value:

Bits 5 to 1 represent the binary coded timer value.

Bits 6 to 8 defines the timer value unit as follows:

Bits

8 7 6

0 0 0 value is incremented in multiples of 10 minutes

0 0 1 value is incremented in multiples of 1 hour

0 1 0 value is incremented in multiples of 10 hours

0 1 1 value is incremented in multiples of 2 seconds

1 0 0 value is incremented in multiples of 30 seconds

1 0 1 value is incremented in multiples of 1 minute

1 1 0 value is incremented in multiples of 320 hours

1 1 1 value indicates that the timer is deactivated.

Example: 10101100 -> 101 means values is incremented in multiples of 1 minute, 01100 means 12 -> the obtained value is 12 minutes

T3324 value:

Bits 5 to 1 represent the binary coded timer value.

Bits 6 to 8 defines the timer value unit for the GPRS timer as follows:

Bits

8 7 6

0 0 0 value is incremented in multiples of 2 seconds

0 0 1 value is incremented in multiples of 1 minute

0 1 0 value is incremented in multiples of decihours

1 1 1 value indicates that the timer is deactivated.

```
AT+CPSMS=1,,,"10101100","00100010"  
OK
```

```
AT+CPSMS?  
+CPSMS: 1,,,"10101100","00100010"  
OK
```

It means that module requires to adopt the PSM for reducing its power consumption. If the network supports PSM and accepts that the UE uses PSM with requested timers value, module enters in PSM when the active timer expires (T3324=2 minutes) and stay in this mode for ten minutes (T3412=12 minutes).

```
AT+CPSMS=0  
OK
```

It means that PSM is set to disable, the module does not go to Power Saving Mode in any case.

3.29.2. AT#CPSMS - Power Saving Mode Setting

This command enables/disables Power Saving Mode (PSM) mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Required | No | No | - | 2 |

 **AT#CPSMS=[<mode>[,<ReqPeriodicRAU>[,<ReqGPRSreadyTimer>[,<ReqPeriodicTAU>[,<ReqActiveTime>[,<psmVersion>[,<psmThreshold>]]]]]]]**

The set command controls the setting of the UEs power saving mode (PSM) parameters. The command controls whether the UE wants to apply PSM or not, as well as the requested extended periodic RAU value and the requested GPRS READY timer value in GERAN, the requested extended periodic TAU value in E-UTRAN and the requested Active Time value.

This command, unlike the **+CPSMS** command, accepts the parameters in integer format.

Parameters:

| Name | Type | Default | Description |
|---------------------|---------|---------|--|
| <mode> | integer | 0 | disables or enables the use of PSM in the UE. |
| Values: | | | |
| | | 0 | : disable |
| | | 1 | : enable |
| <ReqPeriodicRAU> | integer | - | requested extended periodic RAU value (T3312) to be allocated to the UE in GERAN. Parameter expressed in sec. |
| <ReqGPRSreadyTimer> | integer | - | requested GPRS READY timer value (T3314) to be allocated to the UE in |

| | | | |
|------------------|---------|-----|--|
| | | | GERAN. Parameter expressed in sec. |
| <ReqPeriodicTAU> | integer | - | requested extended periodic TAU value (T3412) to be allocated to the UE in E-UTRAN. Parameter expressed in sec. |
| <ReqActiveTime> | integer | - | requested Active Time value (T3324) to be allocated to the UE. Parameter expressed in sec. |
| <psmVersion> | integer | N/A | bitmask to indicate PSM modes. Each bit is configured independently. Default value: <psmValue>=4 |

Values:

- 0 : PSM without network coordination
- 1 : Rel 12 PSM without context retention
- 2 : Rel 12 PSM with context retention
- 3 : PSM in between eDRX cycles

| | | | |
|----------------|---------|----|--|
| <psmThreshold> | integer | 60 | Minimum duration threshold (in sec) to enter PSM. Minimum value is 60 seconds. |
|----------------|---------|----|--|

Value:

- 60 : Minimum value of duration threshold

- i** A special form of the command can be given as **AT#CPSMS=** (with all parameters omitted). In this form, the parameter **<mode>** will be set to 0, the use of PSM will be disabled and data for all parameters in command **#CPSMS** will be removed or, if available, set to the manufacturer specific default values.

-  CPSMS configuration is saved in the file system.

AT#CPSMS?

Read command presents the current CPSMS configuration returned by the network, in the format:

#CPSMS: <status>,[<T3324>],[<T3412 or T3412EXT>],<psmVersion>,<psmThreshold>,<mode>

Additional info:

- ▶ Meaning of the returned parameters.

| Name | Type | Default | Description |
|------------------|---------|---------|---|
| <status> | integer | 0 | PSM status in the network Values: 0 : PSM disabled 1 : PSM enabled |
| <T3324> | integer | - | T3324 timer value in the network, in seconds (could be different from the requested one) |
| <T3412/T3412EXT> | integer | - | T3412 or T3412Ext timer value in the network, in seconds (could be different from the requested one). |

AT#CPSMS=?

Test command returns **OK** result code.

3.29.3. AT#PSMURC - Power Saving Mode URC

Set command enables/disables the URC that informs when modem entering in power saving mode.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|----------------|----------------|-------------|--------|
| Required | Common profile | No | - | 2 |

AT#PSMURC=<en>

The URC format is:

#PSMURC=<ActiveTime>,<PSMTime>

Parameter:

| Name | Type | Default | Description |
|------|---------|---------|----------------------------|
| <en> | integer | 0 | enable/disable URC message |

Values:

0 : disable URC message

1 : enable URC message

Unsolicited fields:

| Name | Type | Description |
|--------------|---------|---|
| <ActiveTime> | integer | requested Active Time value, in seconds (T3324) |
| <PSMTime> | integer | low power phase duration in seconds (difference between T3412 and T3324 including boot time). |

AT#PSMURC?

Read command reports the status (enable/disable):

#PSMURC: <en>

AT#PSMURC=?

Test command reports the supported range of value for parameter:

#PSMURC: (0,1)

The setting is saved using the **&W** command.

3.30. Debugging

3.30.1. AT#TRACE - Enable/Disable Trace

The command selects which trace outputs you want to display through the debugging tool.

| SIM Presence | Setting saved | Can be aborted | MAX timeout | SELINT |
|--------------|---------------|----------------|-------------|--------|
| Not required | No | No | - | 2 |

 **AT#TRACE=[<mode>],[<configurationString>]**

Parameters:

| Name | Type | Default | Description |
|--------|---------|---------|--|
| <mode> | integer | N/A | switches all trace outputs ON or OFF. If parameter <mode> is no entered in the command, the following <configurationString> will be used. |

Values:

- 0 : sets all trace outputs OFF, <configuration String> will be ignored
- 1 : sets all trace outputs ON, <configurationString> will be ignored

| | | | |
|-----------------------|--------|---|--|
| <configurationString> | string | - | enables/disables a set of trace outputs, its syntax is shown in the Additional info section. |
|-----------------------|--------|---|--|

Additional info:

- ▶▶ The syntax of the <configurationString> is:

["<unit>=<umode>[,<unit>=<umode>[,...]]"

Here are the meanings and values of the string parameters.

| Name | Type | Default | Description |
|--------|--------|---------|--|
| <unit> | string | N/A | trace class name available to the user to select the trace output. On the right side of each name, in lower case characters, there is the TC_XXX... string (Trace Class name) shown by the debugging tool. |

Values:

| | | |
|----------|---|-------------|
| generic | : | TC_GENERIC |
| socket | : | TC_SOCKET |
| clock | : | TC_CLOCK |
| pdp | : | TC_PDP |
| gnss | : | TC_GNSS |
| m2m_user | : | TC_M2M_USER |
| fota | : | TC_FOTA |
| fs | : | TC_FS |
| qmi | : | TC_QMI |
| sms | : | TC_SMS |
| info | : | TC_INFO |
| lwm2m | : | TC_LWM2M |
| net | : | TC_NET |
| sim | : | TC_SIM |

| | | |
|----------|---|-----------|
| spi | : | TC_SPI |
| usb | : | TC_USB, |
| nv | : | TC_NV |
| rtc | : | TC_RTC |
| m2m_uart | : | TC_UART |
| power | : | TC_POWER |
| ftpc | : | TC_FTPC |
| ati | : | TC_ATI |
| backup | : | TC_BACKUP |
| nipd | : | TC_NIPD |
| sys | : | TC_SYS |
| psm | : | TC_PSM |
| ssl | : | TC_SSL |

| | | | |
|----------------------|---------|-----|--|
| <umode> | integer | N/A | enables/disables the trace output selected |
|----------------------|---------|-----|--|

Values:

0 : disables

1 : enables

AT#TRACE?

Read command reports the currently selected parameter values in the format:

#TRACE: "<unit>=<umode>,...,<unit>=<umode>"

 **AT#TRACE=?**

Test command returns **OK**.

Here are some examples:

- Set all trace outputs OFF
AT#TRACE=0
OK
- Set all trace outputs ON
AT#TRACE=1
OK
- Enable/disable trace outputs selected
AT#TRACE="generic=1,clock=0,lwm2m=1,pdp=0,gnss=0,ati=0"
OK

4. PRODUCT AND SAFETY INFORMATION

4.1. Copyrights and Other Notices

SPECIFICATIONS ARE SUBJECT TO CHANGE WITHOUT NOTICE

Although reasonable efforts have been made to ensure the accuracy of this document, Telit assumes no liability resulting from any inaccuracies or omissions in this document, or from the use of the information contained herein. The information in this document has been carefully checked and is believed to be reliable. Telit reserves the right to make changes to any of the products described herein, to revise it and to make changes from time to time with no obligation to notify anyone of such revisions or changes. Telit does not assume any liability arising from the application or use of any product, software, or circuit described herein; neither does it convey license under its patent rights or the rights of others.

This document may contain references or information about Telit's products (machines and programs), or services that are not announced in your country. Such references or information do not necessarily mean that Telit intends to announce such Telit products, programming, or services in your country.

4.1.1. Copyrights

This instruction manual and the Telit products described herein may include or describe Telit's copyrighted material, such as computer programs stored in semiconductor memories or other media. Laws in Italy and in other countries reserve to Telit and its licensors certain exclusive rights for copyrighted material, including the exclusive right to copy, reproduce in any form, distribute and make derivative works of the copyrighted material. Accordingly, any of Telit's or its licensors' copyrighted material contained herein or described in this instruction manual, shall not be copied, reproduced, distributed, merged or modified in any manner without the express written permission of the owner. Furthermore, the purchase of Telit's products shall not be deemed to grant in any way, neither directly nor by implication, or estoppel, any license.

4.1.2. Computer Software Copyrights

Telit and the 3rd Party supplied Software (SW) products, described in this instruction manual may include Telit's and other 3rd Party's copyrighted computer programs stored in semiconductor memories or other media. Laws in Italy and in other countries reserve to Telit and other 3rd Party SW exclusive rights for copyrighted computer programs, including – but not limited to - the exclusive right to copy or reproduce in any form the

copyrighted products. Accordingly, any copyrighted computer programs contained in Telit's products described in this instruction manual shall not be copied (reverse engineered) or reproduced in any manner without the express written permission of the copyright owner, being Telit or the 3rd Party software supplier. Furthermore, the purchase of Telit products shall not be deemed to grant either directly or by implication, estoppel, or in any other way, any license under the copyrights, patents or patent applications of Telit or other 3rd Party supplied SW, except for the normal non-exclusive, royalty free license to use arising by operation of law in the sale of a product.

4.2. Usage and Disclosure Restrictions

4.2.1. License Agreements

The software described in this document is owned by Telit and its licensors. It is furnished by express license agreement only and shall be used exclusively in accordance with the terms of such agreement.

4.2.2. Copyrighted Materials

The Software and the documentation are copyrighted materials. Making unauthorized copies is prohibited by the law. The software or the documentation shall not be reproduced, transmitted, transcribed, even partially, nor stored in a retrieval system, nor translated into any language or computer language, in any form or by any means, without prior written permission of Telit.

4.2.3. High Risk Materials

Components, units, or third-party goods used in the making of the product described herein are NOT fault-tolerant and are NOT designed, manufactured, or intended for use as on-line control equipment in the following hazardous environments requiring fail-safe controls: operations of Nuclear Facilities, Aircraft Navigation or Aircraft Communication Systems, Air Traffic Control, Life Support, or Weapons Systems ("High Risk Activities"). Telit and its supplier(s) specifically disclaim any expressed or implied warranty of fitness eligibility for such High Risk Activities.

4.2.4. Trademarks

TELIT and the Stylized T-Logo are registered in the Trademark Office. All other product or service names are property of their respective owners.

4.2.5. 3rd Party Rights

The software may include 3rd Party's software Rights. In this case the user agrees to comply with all terms and conditions imposed in respect of such separate software rights. In addition to 3rd Party Terms, the disclaimer of warranty and limitation of liability provisions in this License, shall apply to the 3rd Party Rights software as well.

TELIT HEREBY DISCLAIMS ANY AND ALL WARRANTIES EXPRESSED OR IMPLIED FROM ANY 3RD PARTY REGARDING ANY SEPARATE FILES, ANY 3RD PARTY MATERIALS INCLUDED IN THE SOFTWARE, ANY 3RD PARTY MATERIALS FROM WHICH THE SOFTWARE IS DERIVED (COLLECTIVELY "OTHER CODES"), AND THE USE OF ANY OR ALL OTHER CODES IN CONNECTION WITH THE SOFTWARE, INCLUDING (WITHOUT LIMITATION) ANY WARRANTIES OF SATISFACTORY QUALITY OR FITNESS FOR A PARTICULAR PURPOSE.

NO 3RD PARTY LICENSORS OF OTHER CODES MUST BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST OF PROFITS), HOWEVER CAUSED AND WHETHER MADE UNDER CONTRACT, TORT OR OTHER LEGAL THEORY, ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE OTHER CODES OR THE EXERCISE OF ANY RIGHTS GRANTED UNDER EITHER OR BOTH THIS LICENSE AND THE LEGAL TERMS APPLICABLE TO ANY SEPARATE FILES, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

4.2.6. Waiver of Liability

IN NO EVENT WILL TELIT AND ITS AFFILIATES BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, GENERAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY INDIRECT DAMAGE OF ANY KIND WHATSOEVER, INCLUDING BUT NOT LIMITED TO REIMBURSEMENT OF COSTS, COMPENSATION OF ANY DAMAGE, LOSS OF PRODUCTION, LOSS OF PROFIT, LOSS OF USE, LOSS OF BUSINESS, LOSS OF DATA OR REVENUE, WHETHER OR NOT THE POSSIBILITY OF SUCH DAMAGES COULD HAVE BEEN REASONABLY FORESEEN, CONNECTED IN ANY WAY TO THE USE OF THE PRODUCT/S OR TO THE INFORMATION CONTAINED IN THE PRESENT DOCUMENTATION, EVEN IF TELIT AND/OR ITS AFFILIATES HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES OR THEY ARE FORESEEABLE OR FOR CLAIMS BY ANY THIRD PARTY.

4.3. Safety Recommendations

Make sure the use of this product is allowed in your country and in the environment required. The use of this product may be dangerous and has to be avoided in areas where:

- it can interfere with other electronic devices, particularly in environments such as hospitals, airports, aircrafts, etc.
- there is a risk of explosion such as gasoline stations, oil refineries, etc. It is the responsibility of the user to enforce the country regulation and the specific environment regulation.

Do not disassemble the product; any mark of tampering will compromise the warranty validity. We recommend following the instructions of the hardware user guides for correct wiring of the product. The product has to be supplied with a stabilized voltage source and the wiring has to be conformed to the security and fire prevention regulations. The product has to be handled with care, avoiding any contact with the pins because electrostatic discharges may damage the product itself. Same cautions have to be taken for the SIM, checking carefully the instruction for its use. Do not insert or remove the SIM when the product is in power saving mode.

The system integrator is responsible for the functioning of the final product. Therefore, the external components of the module, as well as any project or installation issue, have to be handled with care. Any interference may cause the risk of disturbing the GSM network or external devices or having an impact on the security system. Should there be any doubt, please refer to the technical documentation and the regulations in force. Every module has to be equipped with a proper antenna with specific characteristics. The antenna has to be installed carefully in order to avoid any interference with other electronic devices and has to guarantee a minimum distance from the body (20 cm). In case this requirement cannot be satisfied, the system integrator has to assess the final product against the SAR regulation.

The equipment is intended to be installed in a restricted area location.

The equipment must be supplied by an external specific limited power source in compliance with the standard EN 62368-1:2014.

The European Community provides some Directives for the electronic equipment introduced on the market. All of the relevant information is available on the European Community website:

https://ec.europa.eu/growth/sectors/electrical-engineering_en

5. GLOSSARY

| | |
|---------|--|
| ARFCN | Absolute Radio Frequency Channel Number |
| AT | Attention command |
| BA | BCCH Allocation |
| BCCH | Broadcast Control Channel |
| CA | Cell Allocation |
| CBM | Cell Broadcast Message |
| CBS | Cell Broadcast Service |
| CCM | Current Call Meter |
| CLIR | Calling Line Identification Restriction |
| CTS | Clear To Send |
| CUG | Closed User Group |
| DCD | Data Carrier Detect |
| DCE | Data Communication Equipment |
| DCS | Digital Cellular System |
| DGPS | Differential GPS, the use of GPS measurements, which are differentially corrected |
| DNS | Domain Name System |
| DSR | Data Set Ready |
| DTE | Data Terminal Equipment |
| DTMF | Dual Tone Multi Frequency |
| DTR | Data Terminal Ready |
| GGA | GPS Fix data |
| GLL | Geographic Position – Latitude/Longitude |
| GLONASS | Global positioning system maintained by the Russian Space Forces |
| GMT | Greenwich Mean Time |
| GNSS | Any single or combined satellite navigation system (GPS, GLONASS and combined GPS/GLONASS) |
| GPRS | Global Packet Radio Service |
| GPS | Global Positioning System |
| GSA | GPS DOP and Active satellites |
| GSM | Global System Mobile |
| GSV | GPS satellites in view |

| | |
|------|---|
| HDLC | High Level Data Link Control |
| HDOP | Horizontal Dilution of Precision |
| IMEI | International Mobile Equipment Identity |
| IMSI | International Mobile Subscriber Identity |
| IP | Internet Protocol |
| IRA | International Reference Alphabet |
| IWF | Interworking Function |
| ME | Mobile Equipment |
| MO | Mobile Originated |
| MT | <i>either</i> Mobile Terminated <i>or</i> Mobile Terminal |
| NMEA | National Marine Electronics Association |
| NVM | Non-Volatile Memory |
| PCS | Personal Communication Service |
| PDP | Packet Data Protocol |
| PDU | Packet Data Unit |
| PIN | Personal Identification Number |
| PPP | Point to Point Protocol |
| PUK | Pin Unblocking Code |
| RLP | Radio Link Protocol |
| RMC | Recommended minimum Specific data |
| RTS | Request To Send |
| SAP | SIM Access Profile |
| SCA | Service Center Address |
| SMS | Short Message Service |
| SMSC | Short Message Service Center |
| SMTP | Simple Mail Transport Protocol |
| TA | Terminal Adapter |
| TCP | Transmission Control Protocol |
| TE | Terminal Equipment |
| UDP | User Datagram Protocol |
| USSD | Unstructured Supplementary Service Data |
| UTC | Coordinated Universal Time |

| | |
|-------------|-------------------------------------|
| VDOP | Vertical dilution of precision |
| VTG | Course over ground and ground speed |
| WAAS | Wide Area Augmentation System |

6. DOCUMENT HISTORY

| Revision | Date | Changes |
|----------|------------|--|
| 11 | 2021-09-23 | <p>Updated Applicability Table</p> <p>Updated Commands: AT#CPSMS, AT#MONI, AT#MQCFG, AT#MQCFG2, AT#MQCONN, AT#MQDISC, AT#MQEN, AT#MQPUBS, AT#MQREAD, AT#MQSUB, AT#MQTCFG, AT#MQUNS, AT#MQWCFG, AT#NTP, AT#TESTMODE, AT\$GPSCFG, AT+CCID, AT+IFC</p> <p>New Commands: AT#ATUNERSEL, AT#BNDTUNER, AT#GTPEN, AT#MQSNCFG, AT#MQSNCFG2, AT#MQSNCONN, AT#MQSNDISC, AT#MQSNEN, AT#MQSNPUBS, AT#MQSNREAD, AT#MQSNREG, AT#MQSNSOCK, AT#MQSNSTATE, AT#MQSNSUB, AT#MQSNTECFG, AT#MQSNUNS, AT#MQSNWCFG, AT#MQSNWMUP, AT#MQSNWTUP, AT#NIPDCFG, AT#NIPDCONN, AT#NIPDRECV, AT#NIPDSEND, AT#SETHXSTR, AT\$GNSSACP</p> |
| 10 | 2021-08-04 | <p>Updated Applicability Table</p> <p>Updated Commands: AT+CGSN, AT#CGSN, AT#SWPKG, AT#FWSWITCH, AT&K, AT+COPS, AT+CCWA, AT#BND, AT#WS46, AT#IRATTIMER, AT#NB2ENA, AT#JDRENH2, AT#JDR4GCFG, AT+CGEREP, AT#SIMDET, AT#SIMINCFG, AT+CLV, AT#GPIO, AT#SLED, AT#SGACT, AT#SSLSECCFG2, AT+ODIS, AT#M2MRUN, AT#MQCFG, AT#MQCONN, AT\$GPSCFG, AT\$GPSDPO, AT#GTP</p> <p>New Commands: AT#TXCAL4G, AT+CEMODE, AT#SMSRETRY, AT#VSIMSETPROF, AT#VSIMSTAT, AT#VSIMVER, AT#DTMF, AT#ECAM AT\$AGNSSCFG</p> |
| 9 | 2021-02-17 | Updated Commands: #SIMINCFG, #SWPKG |
| 8 | 2021-02-04 | <p>New document template</p> <p>Updated Commands: #AUTOATT, #CEDRXS, #CPSMS, #CSURV, #DGEN, #FWSWITCH, #GTP, #GTPENA, #HTTPQRY, #IRATTIMER, #MQCFG, #MQCFG2, #MQCONN, #MQDISC, #MQEN, #MQPUBS, #MQREAD, #MQSUB, #MQTCFG, #MQUNS, #MQWCFG, #NTP, #SCFGEXT3, #SLASTCLOSURE, #SEND, #SENDEXT, #SENDUDP, #SENDUDPEXT, #SSLCFG, #SSLSECCFG2, #SSLSECDATA, #TESTMODE, \$GPSCFG, +CCLK, +CGDCONT, +M2M</p> <p>New Commands: #ACDB, #ATDCECHECK, #BSRCFG, #CODECINFO, #CPSMSCFG, #DTR, #FIRSTNET, #FPLMN, #FTPCMD, #FTPGETF, #LWM2MSKIP, #M2MREADEXT, #SIMSELGPIOCFG, #SSLSECCA, #TEMPCFG, #TEMPMON, \$GNSSNMEA, \$GPSDPO, +CRSL</p> |
| 7 | 2020-11-05 | <p>Updated Commands: +CLIR, +CPWD, #CEDRXS, #IOTBND, #LTFN, #SSLCFG, #SSLSECCFG2, #SSLSECDATA, #CSURV, \$GPSCFG, \$GPSNMUNEX</p> <p>New Commands: \$GPSR, #NB2ENA, #BNDPRIEXT</p> |
| 6 | 2020-09-23 | Updated Commands: +CMUX, #PORTCFG, #WS46, #IOTBND, #JDR4GCFG, #SIMDET, #SIMPR, #SIMINCFG, #STIA, #DGEN, #GPIO, #TESTMODE, #HTTPCFG, #HTTPSND, #SSLCFG, #SSLSECCFG2, |

| | | |
|---|------------|--|
| | | <p>#SSLSECCFG, #MQPUBS, \$GPSNMUN, \$GPSNMUNEX, ATD, #SSLSECDATA</p> <p>New Commands: ATA, +CHUP, #DIALMODE, +VTS, +VTD, +CLIP, +CLIR, +CCWA, +CLCC, #LTESFN, +CMUT, #OAP, #DVI, #CSURVC, #M2MARG, \$GPSSAV, \$GPSRST, \$GPSACP, #GTP, #GTPENA, #BCCHLOCK, +CRCES, #SNRSET, #IRATTIMER, #FWAUTOSIM, #FOTAURC, \$AGNSS, #PSMURC, +CIREG, #TRACE, #HWVER</p> |
| 5 | 2020-06-01 | <p>Updated Commands: #USBCFG, #FW SWITCH, +IPR, #STIA, #V24CFG, #V24, #ECM, #ECMD, #NWDNS, #SSLCFG, +ODIS, #M2MRUN, #MQCFG, \$GPSCFG, \$GPSNMUN, \$GPSNMUNEX</p> <p>New Commands: #IOTBND</p> |
| 4 | 2020-04-15 | <p>Updated Commands: +IPR, #NWDNS, #SSLSECCFG, #SSLS, +ODIS, #M2MDEL, #M2MRAM</p> <p>New Commands: #USBCFG, #SIMINCFG, #ECM, #ECMD, #SSLI, \$GPSCFG</p> |
| 3 | 2020-03-02 | <p>Updated Commands: #FW SWITCH, #WS46, +CGEREP, +CGDCONT, #SLED, #TESTMODE, #SMTPCFG, #CSURV, #CCIOTOPT, +CCIOTOPT, #M2MDEL, #M2MLIST, #M2MMKDIR, #M2MREAD, #M2MRMDIR, #M2MRUN, #M2MWRITE</p> <p>New Commands: +CMSS, +CSODCP, +CRTDCP, #SYSHALT, #ESMTP, #EADDR, #EUSER, #EPASSW, #ESAV, #ERST, #EMAILD, #EMAILMSG, #SSLCFG, #SSLSECCFG2, #SSLSECCFG, #SSLSECDATA, #SSLEN, #SSLD, #SSLO, #SSLH, #SSLEND, #SSLENDEXT, #SSLRECV, #SSLS, +ODIS, #OTAUPW, #M2MCHDIR, #M2MRAM, #MQEN, #MQCFG, #MQCFG2, #MQWCFG, #MQTCFG, #MQCONN, #MQDISC, #MQSUB, #MQUNS, #MQPUBS, #MQREAD</p> <p>Removed Commands: #DNS</p> |
| 2 | 2019-12-18 | <p>Updated Commands: #PSNT, #BND, #WS46, +CGAUTH, #QSS, #PADFWD, #QDNS, #FTPCFG, #HTTPCFG, +CCIOTOPT</p> <p>New Commands: A/, #/, &W, +IMEISV, +CMUX, #PORTCFG, #FW SWITCH, #IMSPDPSET, #TID, #CEERNETEXT, +CEREG, +CESQ, #JDRENH2, #JDR4GCFG, #SIMDET, #TESTMODE, #SGACTCFG, #SGACTCFGEXT, #SKTRST, #NTP, #NTPCFG, #DNS, #NWDNS, #SMTPCFG, #CCIOTOPT, #M2MDEL, #M2MLIST, #M2MMKDIR, #M2MREAD, #M2MRMDIR, #M2MRUN, #M2MWRITE, #M2MBACKUP, +M2M, \$GPSP, \$GPSSW, \$GPSNMUN, \$GPSNMUNEX</p> |
| 1 | 2019-09-10 | <p>The document title has been updated: "ME310G1/ME910G1/ ML865G1 AT Commands Reference Guide"</p> <p>A long list of commands has been added, refer to the Contents table.</p> |
